Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 PT Synthetic oligonucleotides complementary to a portion of the 5'  
 PT untranslated region of hepatitis C virus (HCV), useful for diagnosing and  
 PT treating HCV infections and hepatocellular carcinoma.  
 XX  
 PS Claim 1; Page 6; 74pp; English.  
 XX  
 CC The invention describes synthetic oligonucleotides complementary to a  
 CC portion of the 5' untranslated region of hepatitis C virus. The  
 CC oligonucleotides may be used in methods for controlling, preventing, and  
 CC treating hepatitis C virus infection, in antisense technology and gene  
 CC therapy, and of detecting the presence of hepatitis C virus in a sample.  
 CC Hepatitis C virus (HCV) is an enveloped, positive sense, single-stranded  
 CC RNA virus which infects hepatocytes. HCV is the major cause of non-A, non  
 CC -B, acute and chronic hepatitis. HCV has been associated with  
 CC hepatocellular carcinoma. The invention describes methods and kits for  
 CC inhibiting replication of HCV, inhibiting the expression of HCV nucleic  
 CC acid and protein, and for treating HCV infections. This sequence  
 CC represents a synthetic DNA-RNA hybrid oligonucleotide used for inhibiting  
 CC HCV replication and expression of HCV

 Synthetic oligonucleotides complementary to a portion of the 5'  
 untranslated region of hepatitis C virus (HCV), useful for diagnosing and

PT treating HCV infections and hepatocellular carcinoma.  
 PS Claim 1, Page 9, 74pp; English.

CC The invention describes synthetic oligonucleotides complementary to a  
 CC portion of the 5' untranslated region of hepatitis C virus. The  
 CC oligonucleotides may be used in methods for controlling, preventing, and  
 CC treating hepatitis C virus infection, in antisense technology and gene  
 CC therapy, and of detecting the presence of hepatitis C virus in a sample.  
 CC Hepatitis C virus (HCV) is an enveloped, positive sense, single-stranded  
 CC RNA virus which infects hepatocytes. HCV is the major cause of non-A, non  
 CC -B, acute and chronic hepatitis. HCV has been associated with  
 CC hepatocellular carcinoma. The invention describes methods and kits for  
 CC inhibiting replication of HCV, inhibiting the expression of HCV nucleic  
 CC acid and protein, and for treating HCV infections. This sequence  
 CC represents a synthetic oligonucleotide used for inhibiting HCV  
 CC replication and expression of HCV

 Oligo:nucleotide(s) complementary to HCV 5' untranslated region - used in  
 the treatment and detection of HCV infection, esp. hepatitis and hepato-  
 carcinoma.

Claim 1, Page 26, 100pp; English.

The sequences given in AAT80211-382 represent synthetic oligonucleotides

CC which are complementary to a portion of the 5' untranslated region (UTR)  
CC of hepatitis C virus (HCV). These sequences may be used in a  
CC pharmaceutical composition for the control or prevention of HCV  
CC infection. They may be used to inhibit replication or expression of HCV  
CC or for detecting the presence of HCV in a sample. They may be used to  
CC inhibit HCV replication in a cell and are therefore useful in the  
CC treatment of HCV infections such as chronic and acute hepatitis and  
CC hepatocarcinoma. This oligo was used in an RNase H assay to determine  
CC whether it binds successfully to its target. Three regions of HCV mRNA  
CC were investigated as RNase sensitive sites. This oligo binds to position  
CC -88 to -65

PT Detecting hepatitis C virus in biological sample involves amplifying  
PT reverse transcribed products of virus RNA using amplification primers  
PT whose sequences correspond to 5' or 3' non-coding region of the virus  
PT RNA.  
XX  
PS Claim 30; Page 27; 28pp; English.  
XX  
XX The present sequence is a probe used in a method for detecting hepatitis  
CC C virus (HCV) RNA in biological samples. The HCV RNA is reverse  
CC transcribed to generate cDNA. This is then amplified with primers  
CC corresponding to the 5' or 3' non-coding region of HCV. The product was  
CC captured by hybridisation to oligonucleotide probes, including the  
CC present sequence, which were covalently attached to latex particles and  
CC deposited on the surface of a flow through membrane. The probe/product  
CC complex was reacted with streptavidin-horseradish peroxidase conjugate,  
CC which catalyses the oxidative conversion of a dye precursor to a blue  
CC dye. The method is useful for the diagnosis of HCV infection in patients,  
CC in testing the efficacy of anti-HCV therapeutic regimes, and in screening  
CC blood for HCV-infected samples. The method provides an improved single-  
CC round, reverse transcription/amplification assay which detects low copy  
CC levels of HCV RNA. The primers and assay system are designed to allow the  
CC co-amplification of multiple regions of the HCV genome, multiple viral  
CC species, and an internal positive control (IPC) RNA (or DNA).  
CC Simultaneous amplification/detection of multiple regions of the HCV

CC genome increases assay sensitivity and the co-amplification of an IPC  
 CC decreases the likelihood of false negative results because of PCR  
 CC inhibition

 PT Inhibiting hepatitis C viral RNA replication in an infected cell for  
 PT treating or preventing viral infection, comprises introducing ribozymes  
 PT specific for a minus strand of the viral 5' non-coding sequence.  
 XX  
 PS Example 2; Col 17; 28pp; English.  
 XX  
 CC The present sequence is an oligonucleotide which was used for in solution  
 CC hybridization to quantitate hepatitis C virus (HCV) RNA following  
 CC ribozyme expression. Ribozymes were identified that can specifically  
 CC cleave HCV RNA in a HCV 5' non-coding sequence, the capsid sequence, the  
 CC NS-5 sequence or any other conserved region of the hepatitis C RNA.  
 CC Ribozymes may be introduced into a cell infected with HCV in order to  
 CC inhibit HCV RNA replication or expression. Unlike prior art compositions  
 CC and methods, compositions comprising these ribozymes effectively reduce  
 CC and eradicate HCV from the infected cells and significantly impair the  
 CC ability of the virus to replicate, thus preventing further dissemination  
 CC of the disease. The composition is inherently specific for HCV and has  
 CC negligible toxicity

XX PS Disclosure; Fig 6; 56pp; English.
XX XX
XX CC This invention describes a novel in silico method, for identifying a
XX CC compound that interacts with sub-domain IIId of the hepatitis C virus
XX CC (HCV) internal ribosome entry site (IRES). The method comprises providing
XX CC atomic co-ordinates of the sub-domain IIId in a storage medium on a
XX CC computer, and using the computer to apply molecular modelling techniques
XX CC to the co-ordinates. The compounds identified by the method of the
XX CC invention are useful in an assay for displacement from a fragment of the
XX CC HCV IRES, by contacting the compound with the HCV IRES and assaying the
XX CC interaction between them. The products of the invention also have
XX CC manufacture of a medicament for treating hepatitis C infection, and for
XX CC treating hepatitis C infection. This sequence represents the Hepatitis c
XX CC virus IRES sub-domain IIId fragment IIId_gc.pdb which is used to
XX CC illustrate the method of the invention. (Updated on 07-AUG-2003 to
XX CC correct OS field.)

PT compound complex from uncomplexed target RNA molecules and test compounds
PT by flow cytometry.
XX
PS Example; Page 60; 131pp; English.
XX
CC The invention relates to a novel method for identifying a test compound
CC that binds to a target RNA molecule comprising separating the detectably
CC labeled target RNA:support-attached test compound complex from
CC uncomplexed target RNA molecules and test compounds. The separating
CC process is carried out by flow cytometry and determining a structure of
CC the type of test compound of the RNA:support-attached test compound
CC complex by mass spectrometry. The method is useful for high-throughput
CC screening of libraries of compounds to identify pharmaceutical leads.
CC This polynucleotide sequence represents one of the target RNA motifs/
CC regions of the invention. (Updated on 27-Oct-2003 to standardise OS

 PT Identifying a test compound that binds to a target RNA molecule for  
 PT treating or preventing amyloidosis, hemophilia, cancer, gigantism,  
 PT diabetes, by contacting a detectably labeled target RNA molecule with a  
 PT library of test compounds.  
 XX  
 XX  
 XX Example; Page 69; 152pp; English.  
 XX  
 CC The invention relates to a method for identifying a test compound that  
 CC binds to a target RNA molecule, which comprises contacting a detectably  
 CC labelled target RNA molecule with a library of test compounds under  
 CC conditions that permit direct binding of the labelled target RNA to a  
 CC member of the library of test compounds so that a detectably labeled  
 CC target RNA-test compound complex is formed. The method is useful for  
 CC screening libraries of compounds for those that are selectively bind to a  
 CC pre-selected target RNA. The compounds are useful for inhibiting the  
 CC formation of a specific bound RNA: host cell factor complexes in vivo.  
 CC They are also useful for treating or preventing diseases associated with  
 CC overproduction or decreased protein function, such as amyloidosis,  
 CC haemophilia, Alzheimer's disease, atherosclerosis, cancer, gigantism,  
 CC inflammation, hypothyroidism, hyperthyroidism, autoimmune disorders, aging,  
 CC disorders, Parkinson's disease or infections (bacterial, viral, fungal).  
 CC The invention is also used in gene therapy. The present sequence is  
 CC Hepatitis C virus (HCV) internal ribosome entry site (IRES) subdomain  
 CC I11d RNA. This sequence is used to illustrate the method of the invention  
 CC

 PT New immunostimulatory composition, useful in inducing an immune response  
 PT against microbial or cancer antigen or allergen.  
 XX  
 XX Disclosure; SEQ ID NO 4; 220pp; English.  
 XX  
 CC The present sequence is that of a stem-loop forming 27-mer from hepatitis  
 CC C virus (HCV) subdomain I11d. This sequence has been reported to be  
 CC critical in HCV internal ribosome entry site (IRES)-mediated translation.  
 CC The invention relates to immunostimulatory RNA oligomers that contain at  
 CC least one guanine and at least one uracil. Such immunostimulatory RNAs  
 CC are known to occur in the context of an IRES. Claimed immunostimulatory  
 CC RNA oligomers are thought to signal through an MyD88-dependent pathway,  
 CC probably through Toll-like receptor (TLR) 7 or TLR8, and are believed to  
 CC be ligands of TLR7 or TLR8. Claimed immunostimulatory compositions  
 CC comprise a G-U-containing RNA oligomer and optionally an antigen,  
 CC especially an allergen, cancer antigen or microbial antigen. Methods are  
 CC provided for activating an immune cell, inducing an immune response,  
 CC stimulating TLR8 or TLR7 signaling, and supplementing a TLR8- or TLR7-  
 CC mediated immune response. The methods and compositions are useful for  
 CC activating immune cells in vivo, in vitro and ex vivo, treating  
 CC infection, treating cancer, identifying a target receptor, and screening  
 CC for additional immunostimulatory compounds.

XX FT      Computer for producing a three dimensional representation of a molecule
XX PT      hepatitis C virus entry site element comprises a machine-readable device,
XX XX      data storage medium, working memory, central processing unit and display.
XX PS      Claim 3; Fig 1c; 39pp; English.
XX CC      The present invention relates to a new computer for producing three
XX CC      dimensional representation of a molecule. The computer of the invention
XX CC      comprises a machine-readable data storage medium, a working memory for
XX CC      storing instructions, a central processing unit coupled to the working
XX CC      memory and machine-readable data storage medium and a display coupled to
XX CC      the central processing unit. The molecule comprises a hepatitis C virus
XX CC      (HCV) internal ribosomal entry site (IRES) element. The invention is
XX CC      useful for producing a three dimensional representation of a molecule
XX CC      comprising hepatitis virus C IRES element, for identifying potential
XX CC      inhibitors of hepatitis C virus translation and for modelling
XX CC      interactions of the IRES with its binding partner, the 40S ribosome
XX CC      subunit. The computer generates the three-dimensional graphical
XX CC      representations of molecules or their portions from a set of structure co-
XX CC      ordinates and displays graphical three-dimensional representation of the
XX CC      HCV IRES stem loops in at least one of domain IId or IIId. The
XX CC      structural data permits the identification of atoms that are important
XX CC      for 40S ribosomal subunit binding. The present nucleic acid sequence
XX CC      represents the hepatitis C virus internal ribosome entry site element
XX CC      domain IId of the invention. This sequence represents residues 252-280
XX CC      of ABK15309

XX XX
XX CC      The invention relates to a nucleic acid probe for the classification of
XX CC      hepatitis C virus (HCV) into 3 genotypes. The 3 HCV genotypes are H1, H2 and
XX CC      (type 1), H2a, H2b, H2c, H2d, H2e, H2f, H2g, H2h, H2i, H2j, H2k, H2l, H2m, H2n, H2o, H2p, H2q, H2r, H2s, H2t, H2u, H2v, H2w, H2x, H2y, H2z, H3, H4, H5, H6, H7, H8, H9, H10, H11, H12, H13, H14, H15, H16, H17, H18, H19, H20, H21, H22, H23, H24, H25, H26, H27, H28, H29, H30, H31, H32, H33, H34, H35, H36, H37, H38, H39, H40, H41, H42, H43, H44, H45, H46, H47, H48, H49, H50, H51, H52, H53, H54, H55, H56, H57, H58, H59, H60, H61, H62, H63, H64, H65, H66, H67, H68, H69, H70, H71, H72, H73, H74, H75, H76, H77, H78, H79, H80, H81, H82, H83, H84, H85, H86, H87, H88, H89, H90, H91, H92, H93, XX
XX New large comb-type branched polynucleotides - useful as amplification
XX multimers in nucleic acid hybridisation assays.
XX
XX Example 6; Col 25; 33pp; English.
XX
XX The invention relates to a large comb-type branched polynucleotide of
XX formula 3'-A-S-(S'-X')m-S'-5'; where X' is a branched site joined to -
XX (R)n-S'-E-L; A = an oligonucleotide complementary to an analyte nucleic
XX acid sequence; S = a first spacer segment of 1-50 linked monomers where
XX each monomer is selected from nucleotides and a cleavable linker R; S' =
XX a branching site spacer segment of 0-15 linked monomers where each of the
XX monomers is selected from nucleotides and cleavable linker R; X' = a
XX multifunctional nucleotide that provides a branch site; m = 1-100; S' =
XX a second spacer segment of 0-10 linked monomers where each of the
XX monomers is selected from nucleotides and cleavable linker R; R = a
XX cleavable linker molecule; n = 0 or 1; S'' = a third spacer segment of 0
XX -10 linked monomers where each of the monomers is selected from
XX nucleotides and cleavable linker R; E = an oligonucleotide segment of 5-
XX 10 nucleotides; L = an oligonucleotide containing 2-10 iterations of a
XX nucleotide sequence complementary to a labelled nucleic acid probe. The
XX invention also relates to a branched nucleic acid polymer. The poly-
XX nucleotides are useful as amplification multimers in nucleic acid
XX clinical diagnostics. Since the polynucleotide multimers include a large
XX number (at least 20) iterations of a sequence that are available for
XX specific hybridisation, they permit a greater degree of amplification and
XX decrease the threshold level of a detectable analyte. The present
XX sequence represents a hepatitis C virus (HCV) amplifier probe. (Updated

PT Improved nucleic acid hybridisation assays - using large comb-type

PT polypeptide(s).

PS Example 6; Col 24; 31pp; English.

XX Oligonucleotides AAV83063-80 represent amplifier probes, used in a

CC sandwich hybridisation assay for Hepatitis C virus (HCV) DNA. The

CC sandwich hybridisation assay utilises the comb-type branched

CC polynucleotide amplification multimer of the invention. This large comb-

CC type branched polynucleotide comprises a polynucleotide backbone having

CC at least 15 multifunctional nucleotides each defining a sidechain having

CC and pendant polynucleotide sidechains extending from the multifunctional

CC nucleotides, each comprising iterations of an single stranded

CC oligonucleotide unit capable of binding specifically to a second single-

CC stranded polynucleotide sequence. The total number of iterations in all

CC sidechains is at least 20. The first single-stranded polynucleotide

CC sequence is a labelled polynucleotide, directly or indirectly linked to a

CC nucleic acid analyte. In the nucleic acid hybridisation assay of the

CC invention, the labelled nucleic acid probe is hybridised to the branched

CC polymeric nucleotide via the second single-stranded oligonucleotide unit.

CC The comb-type branched polynucleotides are used as amplification

CC multimers in nucleic acid hybridisation assays and other assays such as

CC direct, indirect and sandwich assays

PT Determining presence or absence of a predetermined endogenous nucleic

PT acid sequence by using an enzyme that depolymerizes the 3' end of an

PT oligonucleotide probe hybridized to a target sequence to release

PT identifier nucleotides.

PS Example; Page 349; 389pp; English.

XX The present invention describes a method (M1) for determining the

CC presence or absence of a predetermined endogenous nucleic acid target

CC sequence (ENMT). The method comprises hybridising a probe having an

CC identifier nucleotide (IN) with ENMT which is treated with an enzyme that

CC depolymerises the 3' end of hybridised NA to release the INs. M1 is used

CC for determining the number of known sequence repeats present in a nucleic

CC acid target sequence in a nucleic acid sample. The method is also useful

CC for determining whether a nucleic acid target sequence in a sample is an

CC allele from a homozygous or heterozygous locus. The method is also useful

CC for detection of mutations, translocations and SNPs in nucleic acids

CC (including those associated with genetic disease), determination of viral

CC load, species identification, sample contamination, and analysis of

CC forensic samples. AAA86971 to AAA87079 and AAA812817 represent sequence

CC which are used in the exemplification of the present invention. N.B.

CC There is a discrepancy between the SEQ ID NO: and sequences given in the

CC examples, and the SEQ ID NO: and sequences given in the sequence listing

CC from the present invention

Soln. phase sandwich hybridisation assays for nucleic acid(s) - with capture extender molecules or competitive oligo:nucleotide(s) to minimise background signal, increasing sensitivity and selectivity.

Example 1; Page 33; 86bp; English.

AAQ98098-098099 are capture extender probes (CEs) used in a new improved method of solution phase sandwich hybridisation assays. The capture extender probes contain an analyte binding sequence (ABS) and a support binding sequence (SBS) which hybridise to a sequence present in a capture probe when immobilised on a solid support. The analyte binding sequences are different in each capture extender probe and the capture probes contain two CE-binding sequences, so that two different CE can bind to a single capture probe. The new method minimises background signals (caused by non-specific hybridisation), this improves both sensitivity and selectivity of the assay without increasing cost or time

PT Polynucleotide array for genetic applications, has two sets of multiple  
PT features, with features of first set having longer polynucleotide  
PT molecules (400 nucleotides) than features of second set with 100  
PT nucleotides.  
XX  
PS Disclosure; Page 9; 18pp; English.  
XX  
CC The present invention describes a polynucleotide array (I), which  
CC comprises a first set of multiple features, where each feature  
CC independently has first polynucleotide molecules (PM1) of at least 400  
CC nucleotides in length, and a second set of features, where each feature  
CC independently has second polynucleotide molecules (PM2) of no more than  
CC 100 nucleotides in length. Also described: (1) a kit comprising (I) and  
CC polynucleotide controls which are, or their complements are, at least 70%  
CC complementary to sequences of respective second polynucleotides; and (2)  
CC fabricating (M) a polynucleotide array, by forming a first set of  
CC multiple features on a substrate, with each feature independently having  
CC PM1 and forming a second set of features on the substrate, with each  
CC feature independently having PM2. (I) is useful in a method involving  
CC exposing (I) to control targets, such that the control targets hybridise  
CC at least 100 times more efficiently to respective second features than  
CC they do to any of the first features, and simultaneously exposing (I) to  
CC a sample, where the second set of features hybridise more efficiently  
CC with control targets than any of the first set features hybridise to any  
CC control targets. The method further involves reading the array to obtain  
CC an image representing the amount of polynucleotides which have bound to  
CC first and second set features, and evaluating locations of first features  
CC in the image using the locations of second features in the image. (I) is  
CC useful in diagnostic, screening, gene expression analysis, and other  
CC applications. (I) is also useful for detecting polymorphisms or splice  
CC variants. The present sequence represents a Hepatitis C virus control  
CC features related 60-mer oligonucleotide, designated HCV0188, which is  
CC given in the exemplification of the present invention

PT Self-assembly formed from amplified target gene and probe pairs for  
 PT simple and accurate detection of the target gene.

XX Example Examples; Page 34; 123pp; Japanese.

XX The invention relates to a method for forming an oligonucleotide self-  
 CC assembly, in which oligonucleotides containing a target gene sequence are  
 CC first amplified by a conventional gene amplification method, and the  
 CC amplification product is then incorporated into the self-assembly by  
 CC reaction with one or more oligonucleotide probe pairs. Also disclosed is  
 CC the detection of a specific gene using the novel method. The  
 CC oligonucleotide probe pairs (which may consist of one pair, or two or  
 CC more different pairs) consist of at least three distinct hybridizing  
 CC regions which are each complementary to a region on the other probe of  
 CC the pair, or to a region on the target oligonucleotide. Preferably each  
 CC complementary region includes at least one G-C coupling. The regions  
 CC of the probe sequence and those complementary to the target  
 CC oligonucleotides at outer parts of the probe pair may be in the internal part  
 CC of the probe sequence and those complementary to the target  
 CC oligonucleotides at outer parts of the probe pair, by hybridisation of  
 CC the central complementary regions of the probes. This dimer is then  
 CC hybridised with the target oligonucleotides, each 3' or 5' terminal  
 CC portion of the probe dimer hybridizing to a different region on one or  
 CC other strand of the target oligonucleotide sequence. The probes may be  
 CC DNA, RNA, PNA or LNA. The 3' and/or 5' terminals of the probes may be  
 CC methylated. The oligonucleotides may be synthesised in the initial  
 CC amplification reaction from single or double stranded DNA or RNA and the  
 CC synthesis may include ligation of a target sequence to sequences  
 CC complementary to the probe pairs. They may be enzymatically cleavable by  
 CC exonuclease, RNase H or restriction enzymes. This method is an accurate,  
 CC specific and sensitive method for the detection of a target gene sequence  
 CC at low cost and without complicated procedures or apparatus. The current  
 CC sequence represents a synthesised bridge probe utilised in an example  
 CC from the invention.

PT	Quantitating target nucleic acid involves competitively amplifying target
PT	nucleic acid and reference sequences containing homologous sequences with
PT	respect to target, and determining amplified product obtained for the
PT	sequences.
XX	
PS	Claim 6; SEQ ID NO 3, 26pp; Japanese.
XX	
CC	This invention relates to a novel method for quantitating the amount of
CC	target nucleic acid molecules present in a sample. Specifically, it
CC	refers to competitively amplifying (using the same primer set) the target
CC	oligonucleotides and a number of reference sequences that are partially
CC	homologous to the target, where the concentration for each set is equal
CC	and amplified product obtained for each type of sequence can be
CC	determined and measured. The present invention describes this method as
CC	useful for quantitating target nucleic acids such as those derived from a
CC	viral genome or mRNA, in order to establish the presence and identity of
CC	a viral infection, as well as the degree of viremia. Accordingly, the
CC	method also enables measurement of the degree of responsiveness following
CC	treatment with a medicament by measuring target mRNA in the subject. This
CC	polynucleotide sequence is reference DNA from the hepatitis C virus that
CC	shares partial homology with the target nucleic acid of the invention.

PT		PT	Ligation dependent polymerase chain reaction - for the detection of infectious pathogens and abnormal human genes, e.g. HIV and neoplasia.	
XX		PS	Example B; Page 62; 100pp; English.	
CC		CC	A novel method of detecting a target nucleic acid (TNA) sequence involves use of the ligase dependent polymerase chain reaction method (LD-PCR). In this method, two probes are provided. The first probe contains a region at the 5' end which is complementary and will hybridise with the TNA, the 3' end of the first probe is generic and is bound to one half of a ligand binding pair (LBP). The second probe contains a region at the 5' end which is complementary to a region in the TNA which is immediately adjacent to the complementary region of the first probe. When the probes are bound to the TNA, they can be ligated together using a conventional ligase. The TNA-ligated probe complex can be isolated by binding the first probe to a paramagnetic bead to which is attached the second half of the LBP. The TNA can be dissociated from the ligated probe complex which can then be detected either by a label attached to the second probe, by using an external probe or by PCR using the ligated probes as a template. The capture probes AAT09176-7 are used to isolate a region of the Hepatitis C virus 5' untranslated region. This probe can be used to detect this region by hybridisation such that the 5' and 3' ends of the probe lie adjacent to each other when hybridised to the TNA, resulting in closed circular mol. after ligation. The ligated sequence can subsequently be detected by PCR amplification with the primers AAT09181-2

XX Detection of target nucleic acids in samples - using capture and  
 PT amplification probes, paramagnetic particles and ligation to form a  
 PT nucleotide sequence which can be detected.

XX Example 8; Page 70; 136pp; English.

XX The present sequence represents a probe used in an example of the present  
 CC invention for the detection of HCV RNA in a sample. The present invention  
 CC describes methods for: (A) detecting a target nucleic acid (NA) in a  
 CC sample; (B) in situ detection of a target NA in a sample; (C) detecting  
 CC an antigen in a sample; and (D) detecting an antibody in a sample. The  
 CC methods can be used for the rapid automated detection and monitoring of  
 CC pathogenic organisms, as well as the detection of abnormal genes in an  
 CC individual. The methods allow for isolation, amplification and detection  
 CC of NA sequences corresponding to the target NA to be carried out in the  
 CC same receptacle, e.g. tube or micro-well plate. The method also allows  
 CC for standardisation of conditions, because only a pair of generic  
 CC amplification probes may be utilised in the present method for detecting  
 CC a variety of target NAs, thus allowing efficient multiplex amplification.  
 CC The method also allows the direct detection of RNA by probe amplification.  
 CC without the need for DNA template production. The amplification probes,  
 CC which may be covalently joined end to end, form a contiguous ligated  
 CC amplification sequence. The assembly of the amplifiable DNA by ligation  
 CC increase specificity, and makes possible the detection of a single  
 CC mutation in a target

XX Detection of target nucleic acids in samples - using capture and  
 PT amplification probes, paramagnetic particles and ligation to form a  
 PT nucleotide sequence which is amplified.

XX Example 8; Page 67; 142pp; English.

XX The present sequence represents a probe, designated Amp-probe-2 (HCV C),  
 CC used for detecting the 5' untranslated region (5' UTR) of Hepatitis C  
 CC virus RNA. Nucleotides 1-26 at the 5' end of the probe are complementary  
 CC to a portion of the 5'UTR of the HCV genome. The probe is used to  
 CC exemplify the method of the invention, which describes the detection of a  
 CC target nucleic acid in a sample. The method comprises contacting the  
 CC paramagnetic particles coated with a ligand binding moiety. Each  
 CC capture/amplification probe has a ligand bound to its non-complementary  
 CC sequence that is capable of binding to and forming an affinity pair with  
 CC the ligand binding moiety coated onto the paramagnetic particles. The  
 CC oligonucleotide probes also comprise a probe that can be circularised, by  
 CC having the 3' and 5' ends ligated together. The circularised probe is  
 CC amplified with a DNA polymerase having strand displacement activity under  
 CC conditions whereby an extension primer is extended around the circle for  
 CC multiple revolutions to form a single stranded DNA of repeating units  
 CC complementary to the sequence of the circular probe, and multiple copies  
 CC of a second extension primer hybridizes to complementary regions of the  
 CC single stranded DNA and are extended by the DNA polymerase to provide  
 CC extension products. The extension products of the second extension primer  
 CC displace downstream copies of the second extension primer and  
 CC corresponding extension products to provide displaced single strands to  
 CC which multiple copies of the first extension primer bind and are extended  
 CC by the DNA polymerase. The amplified DNA is detected. The method can be  
 CC used for the rapid automated detection and monitoring of pathogenic  
 CC organisms as well as the detection of abnormal genes in an individual.

CC oligonucleotide probe under conditions that allow hybridisation between  
 CC complementary sequences in the target nucleic acid and the circular  
 CC oligonucleotide probe, adding at least one forward primer comprising a  
 CC sequence complementary to a portion of the circular oligonucleotide  
 CC probe, adding an oligonucleotide primer pair comprising a first primer  
 CC and a second primer where the first primer of the pair comprises a first  
 CC sequence that is substantially identical to a portion of the circular  
 CC oligonucleotide probe, a second sequence that is complementary to the  
 CC second primer of the pair, and a signal generating moiety, the second  
 CC primer of the pair comprises a sequence that is complementary to the  
 CC first primer and a moiety capable of quenching, masking or inhibiting the  
 CC activity of the signal generating moiety, and when the first primer and  
 CC the second primer are bound to one another, the signal is inhibited,  
 CC adding at least one reverse primer comprising a sequence that is  
 CC substantially identical to a portion of the circular oligonucleotide  
 CC probe, adding a DNA polymerase, and amplifying the circular  
 CC oligonucleotide probe and separating the signal generating moiety and the  
 CC quenching, masking or inhibitory moiety to generate a signal, where  
 CC the detection of signal indicates the presence of the target nucleic acid in  
 CC the sample. Also included are a kit for (M1) and amplifying (M2) a  
 CC circular nucleic acid sequence. In (M1), the circular oligonucleotide  
 CC probe is formed by ligating the 3' and 5' ends of linear oligonucleotide  
 CC sequences in the target nucleic acid under conditions that allow  
 CC hybridisation between complementary sequences in the target nucleic acid  
 CC and the linear oligonucleotide probe. The circular probe is amplified  
 CC using an amplification method chosen from polymerase chain reaction,  
 CC strand displacement amplification, transcription mediated amplification,  
 CC ramification-extension amplification method (RAM) and primer extension.  
 CC (M1) is useful for detecting a target nucleic acid in a sample. (M2) is  
 CC useful for amplification of genomic DNA and total mRNAs expressed in  
 CC cells and for analysing differential mRNA expression. (M1) is useful for  
 CC detecting genetic variations in nucleic acids in sample from patients  
 CC with genetic diseases or neoplasia. The DNA and/or mRNA amplified by (M2)  
 CC is used in techniques developed for detection of infectious agents, and  
 CC to detect and monitor pathogenic microorganisms in a test sample, as well  
 CC as to detect abnormal genes in an individual. (M1) is useful for routine  
 CC diagnostic testing in a clinical laboratory setting. The present sequence  
 CC is an amplification probe used to demonstrate the above methods.

XX
XX Hepatitis C virus (HCV) anti-sense RNA - inhibits HCV structural gene
XX expression in vivo for treatment of HCV infection.
XX
XX Claim 2; Page 10; 12pp; Japanese.

```

```

XX
XX The present sequence is a specifically claimed example of RNA that is
XX complementary (i.e. antisense) to part of the 5'-untranslated region of
XX the hepatitis C virus genome sequence contained in clone 2-1. The 5'-UTR
XX includes several stem-loop sequences. The antisense RNA is useful for
XX inhibiting expression of HCV structural genes and thereby inhibiting
XX viral replication in vivo. The antisense therapy can be used in addition
XX to conventional interferon treatment of HCV infections

PT New oligo ribonucleotide or peptide nucleic acid capable of sequence-  
PT specifically binding with RNA of hepatitis C virus, useful for inhibiting  
PT proliferation of hepatitis C virus and useful as hepatitis C virus  
PT therapeutic agent.  
XX  
PS Example 6; SEQ ID NO 53; 80pp; Japanese.  
XX  
CC The invention relates to an oligo ribonucleotide or peptide nucleic acid  
CC (I) capable of sequence-specifically binding with RNA of hepatitis C  
CC virus (HCV), and comprising a sequence hybridising under stringent  
CC conditions with RNA of HCV. The method of the invention relates to the  
CC inhibition of the proliferation of HCV. The oligo ribonucleotide or  
CC peptide nucleic acid of the invention is useful for inhibiting the  
CC proliferation of HCV which involves contacting (I) with RNA of HCV. (1)  
CC is useful as a therapeutic agent of hepatitis C. The current sequence  
CC represents a PCR product from an example of the invention.

PT which is amplified and detected, is more sensitive than a comparable  
PT ELISA and is useful to detect prion protein or lectin.  
XX  
PS Example 2; Page 35; 44pp; German.  
XX  
CC This invention describes a novel method of detecting a substance in a  
CC test sample. The method comprises forming a detector complex, in which  
CC the substance is bound to a connection agent conjugated to a detector  
CC nucleic acid which is replicated with a replication agent. A competitor  
CC nucleic acid which competes for the replication agent is also added and  
CC replication of the detector and competitor nucleic acids is determined.  
CC Preferably two or more binding reagents and/or two or more detector  
CC nucleic acids are used. The detected substance is preferably immobilised  
CC on a solid surface. Preferably the substance is bound to an immobilised  
CC binding reagent connected to a first immobilised nucleic acid, which is  
CC hybridised to a second nucleic acid bound to a solid surface. A negative  
CC control is preferably also performed using the detector and competitor  
CC nucleic acids in the absence of the substance and the mix of replicated  
CC detector and competitor nucleic acids in the sample test compared to the  
CC negative control test. The method is useful for detecting a substance,  
CC particularly a prion protein or a lectin in a liquid and is more  
CC sensitive than a comparable ELISA. This sequence represents  
CC polynucleotide fragment KF-2 which is a competitive inhibitor of murine  
CC IGG designated DNA-169, used in an assay described in the invention.

CC The invention relates to detecting a mutation. The method involves  
CC amplifying a target polynucleotide using a forward primer and a reverse  
CC primer; generating fragments of two or more single-stranded  
CC polynucleotides including one or more mutations sequence having the size  
CC of 2-32 bases by cleaving the amplified target polynucleotide with  
CC restriction enzymes, where the second restriction enzyme does not react  
CC while a first restriction enzyme is reacted with the amplified  
CC polynucleotide; and measuring the molecular weight of the cleaved  
CC fragments. The polynucleotide is cleaved to include one mutation among  
CC two or more different mutations in only one single stranded  
CC polynucleotide fragment and all mutations in the other single stranded  
CC nucleotide fragment. Restrictions enzyme treatment step is performed  
CC using restriction enzymes having different optimum temperatures. The  
CC method is useful in detecting a mutation. The method and primer are  
CC useful in diagnosing, prognosing, treating and preventing a disease, e.g.  
CC cancer or hepatitis B or C virus. The present sequence represents a HCV  
CC template DNA sequence.

PT Detection and characterisation of nucleic acid sequences - by mixing a  
 PT folded target and one or more probes to form a probe/folded target  
 PT complex and detecting and characterising the complexes.

PS Example 5; Page 172-173; 279pp; English.

CC The invention relates to methods and compositions of detection and  
 CC characterisation of nucleic acid sequences and sequence changes. One  
 CC method of detection and characterisation comprises: (a) providing: (i) a  
 CC folded target having a DNA sequence comprising at least 1 double stranded  
 CC region and at least 1 single stranded region; and (ii) at least 1 probe  
 CC complementary to at least a portion of the folded target; and (b) mixing  
 CC the target and probes so that the probe hybridises to form a probe  
 CC /folded target complex. Also provided are methods for determination of  
 CC structure formation in nucleic acid targets; for analysing folded nucleic  
 CC acids targets; and for analysis of nucleic acid structures. The methods  
 CC can be used for the detection and characterisation of nucleic acid  
 CC sequences to detect the presence of pathogenic nucleic acid sequences  
 CC indicative of an infection, the presence of variants or alleles of  
 CC mammalian genes associated with disease and cancers, and the  
 CC identification of the source of nucleic acids found in forensic samples,  
 CC as well as in paternity determinations. The methods allow simultaneous  
 CC analysis of both strands (e.g. the sense and antisense strands) and are  
 CC ideal for high-level multiplexing. The products produced are amenable to  
 CC qualitative, quantitative and positional analysis. The methods may be  
 CC performed in solution or in the solid phase (e.g. on a solid support).

CC The methods are powerful in that they allow for analysis of longer  
 CC fragments of nucleic acid than current methodologies. Sequences AAV70453-  
 CC 61 represent partial sequences of different amplicons of hepatitis C  
 CC virus (HCV) subtypes 1a, 1b, 2c and 3a. These partial sequences are used  
 CC for identifying the HCV subtypes

XX Identifying oligonucleotides hybridizing to nucleic acids containing  
 PT secondary structure, useful in clinical diagnosis, comprises identifying  
 PT primers that interact with the target to form an extension product under  
 PT amplification conditions.

XX Example 5; Page 366; 409pp; English.

XX The present invention describes a method for identifying oligonucleotides  
 CC with desired hybridisation properties to nucleic acid targets containing  
 CC secondary structure. The method comprises amplifying a target nucleic  
 CC acid having at least one accessible and one inaccessible site. Primers  
 CC that form an extension product are identified as the oligonucleotides  
 CC which can interact with the folded target nucleic acid. Oligonucleotides  
 CC from the present invention can be used in novel detection methods for  
 CC clinical diagnostic purposes, including the detection and identification  
 CC of pathogenic organisms (e.g. HIV). The method allows the ability to  
 CC rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent  
 CC sequences used in the exemplification of the present invention

XX Analyzing nucleic acids, comprises mixing target nucleic acid such as

XX hepatitis C virus nucleic acid, bridging oligonucleotide, second

XX oligonucleotide and cleavage agent to form cleavage structure.

XX Example 5; SEQ ID NO 37; 143pp; English.

XX The invention describes a method of analysing nucleic acids comprising  
 CC providing a target nucleic acid, e.g. hepatitis C virus nucleic acid  
 CC having non-contiguous single-stranded regions (NCSR) separated by an  
 CC intervening region, a bridging oligonucleotide capable of binding to the  
 CC first and second NCSR; a second oligonucleotide binding to a portion of  
 CC the first NCSR and a cleavage agent, and mixing the contents to form a  
 CC cleavage structure. The method is useful for analysing nucleic acids,  
 CC e.g. hepatitis C virus nucleic acid useful for clinical diagnostic  
 CC purposes and detection and identification of pathogenic microorganisms  
 CC such as hepatitis C virus. This sequence represents a hepatitis C virus  
 CC polynucleotide that is sufficient for identification of HCV subtypes  
 CC using the analysis methods of the invention.

 PT Detection and characterisation of nucleic acid sequences - by mixing a  
 PT folded target and one or more probes to form a probe/folded target  
 PT complex and detecting and characterising the complexes.  
 XX  
 PS Example 5; Page 172; 279pp; English.  
 XX  
 CC The invention relates to methods and compositions of detection and

CC characterisation of nucleic acid sequences and sequence changes. One  
 CC method of detection and characterisation comprises: (a) providing: (i) a  
 CC folded target having a DNA sequence comprising at least 1 double stranded  
 CC region and at least 1 single stranded region; and (ii) at least 1 probe  
 CC complementary to at least a portion of the folded target; and (b) mixing  
 CC the target and probes so that the probe hybridises to form a probe  
 CC /folded target complex. Also provided are methods for determination of  
 CC structure formation in nucleic acid targets; for analysing folded nucleic  
 CC acids targets; and for analysis of nucleic acid structures. The methods  
 CC can be used for the detection and characterisation of nucleic acid  
 CC sequences to detect the presence of pathogenic nucleic acid sequences  
 CC indicative of an infection, the presence of variants or alleles of  
 CC mammalian genes associated with disease and cancers, and the  
 CC identification of the source of nucleic acids found in forensic samples,  
 CC as well as in paternity determinations. The methods allow simultaneous  
 CC analysis of both strands (e.g. the sense and antisense strands) and are  
 CC ideal for high-level multiplexing. The products produced are amenable to  
 CC qualitative, quantitative and positional analysis. The methods may be  
 CC performed in solution or in the solid phase (e.g. on a solid support).  
 CC The methods are powerful in that they allow for analysis of longer  
 CC fragments of nucleic acid than current methodologies. Sequences AAV70453-  
 CC 61 represent partial sequences of different amplicons of hepatitis C  
 CC virus (HCV) subtypes 1a, 1b, 2c and 3a. These partial sequences are used  
 CC for identifying the HCV subtypes

PT Analyzing nucleic acids, comprises mixing target nucleic acid such as  
PT hepatitis C virus nucleic acid, bridging oligonucleotide, second  
PT oligonucleotide and cleavage agent to form cleavage structure.  
XX

PS Example 5; SEQ ID NO 38; 143pp; English.

XX The invention describes a method of analysing nucleic acids comprising  
CC providing a target nucleic acid, e.g. hepatitis C virus nucleic acid  
CC having non-contiguous single-stranded regions (NCSR) separated by an  
CC intervening region, a bridging oligonucleotide capable of binding to the  
CC first and second NCSR; a second oligonucleotide binding to a portion of  
CC the first NCSR and a cleavage agent, and mixing the contents to form a  
CC cleavage structure. The method is useful for analysing nucleic acids,  
CC e.g. hepatitis C virus nucleic acid useful for clinical diagnostic  
CC purposes and detection and identification of pathogenic microorganisms  
CC such as hepatitis C virus. This sequence represents a hepatitis C virus  
CC polynucleotide that is sufficient for identification of HCV subtypes  
CC using the analysis methods of the invention.

 PT Amplification of a target nucleic acid region using a specific control  
 sequence.  
 PS Example 1; Page 18; 28pp; English.  
 XX  
 CC The invention relates to a method for amplification of a target nucleic  
 CC acid region in a sample using a specific control sequence. The invention  
 CC is also directed to a method of determination of a target nucleic acid  
 CC using a special control nucleic acid. Nucleic acids of the invention are  
 CC used as a control in a reaction for amplifying target nucleic acids and  
 CC as a control in a hybridisation reaction for determination of target  
 CC nucleic acids. The present sequence is HCV (Hepatitis C virus) type I  
 CC target DNA. This sequence is used to illustrate the methods of the  
 CC invention

 PT Detection and characterisation of nucleic acid sequences - by mixing a  
 PT folded target and one or more probes to form a probe/folded target  
 PT complex and detecting and characterising the complexes.  
 PS Example 5; Page 170-171; 279pp; English.  
 XX  
 CC The invention relates to methods and compositions of detection and  
 CC characterisation of nucleic acid sequences and sequence changes. One  
 CC method of detection and characterisation comprises: (a) providing: (i) a  
 CC folded target having a DNA sequence comprising at least 1 double stranded  
 CC region and at least 1 single stranded region; and (ii) at least 1 probe  
 CC complementary to at least a portion of the folded target; and (b) mixing  
 CC the target and probes so that the probe hybridises to form a probe  
 CC /folded target complex. Also provided are methods for determination of  
 CC structure formation in nucleic acid targets; for analysing folded nucleic  
 CC acids targets; and for analysis of nucleic acid structures. The methods  
 CC can be used for the detection and characterisation of nucleic acid  
 CC sequences to detect the presence of pathogenic nucleic acid sequences  
 CC indicative of an infection, the presence of variants or alleles of  
 CC mammalian genes associated with disease and cancers, and the  
 CC identification of the source of nucleic acids found in forensic samples,  
 CC as well as in paternity determinations. The methods allow simultaneous  
 CC analysis of both strands (e.g. the sense and antisense strands) and are  
 CC ideal for high-level multiplexing. The products produced are amenable to  
 CC qualitative, quantitative and positional analysis. The methods may be  
 CC performed in solution or in the solid phase (e.g. on a solid support).

CC The methods are powerful in that they allow for analysis of longer  
 CC fragments of nucleic acid than current methodologies. Sequences AAV70453-  
 CC 61 represent partial sequences of different amplicons of hepatitis C  
 CC virus (HCV) subtypes 1a, 1b, 2c and 3a. These partial sequences are used  
 CC for identifying the HCV subtypes

 CC indicative of an infection, the presence of variants or alleles of  
 CC mammalian genes associated with disease and cancers, and the

CC identification of the source of nucleic acids found in forensic samples,  
 CC as well as in paternity determinations. The methods allow simultaneous  
 CC analysis of both strands (e.g. the sense and antisense strands) and are  
 CC ideal for high-level multiplexing. The products produced are amenable to  
 CC qualitative, quantitative and positional analysis. The methods may be  
 CC performed in solution or in the solid phase (e.g. on a solid support).  
 CC The methods are powerful in that they allow for analysis of longer  
 CC fragments of nucleic acid than current methodologies. Sequences AAV70449-  
 CC 52 represent a hepatitis C virus (HCV) subtype sequences produced by PCR.  
 CC These PCR products can be used in hybridisation analysis using multiple  
 CC capture probes for HCV genotyping

XX PT Analyzing nucleic acids, comprises mixing target nucleic acid such as  
 PT hepatitis C virus nucleic acid, bridging oligonucleotide, second  
 PT oligonucleotide and cleavage agent to form cleavage structure.

XX PS Example 8; SEQ ID NO 127; 143pp; English.

XX The invention describes a method of analysing nucleic acids comprising  
 CC providing a target nucleic acid, e.g. hepatitis C virus nucleic acid  
 CC having non-contiguous single-stranded regions (NCSR) separated by an  
 CC intervening region, a bridging oligonucleotide capable of binding to the  
 CC first and second NCSR; a second oligonucleotide binding to a portion of  
 CC the first NCSR and a cleavage agent, and mixing the contents to form a  
 CC cleavage structure. The method is useful for analysing nucleic acids,  
 CC e.g. hepatitis C virus nucleic acid useful for clinical diagnostic  
 CC purposes and detection and identification of pathogenic microorganisms  
 CC such as hepatitis C virus. This sequence represents a hepatitis C virus  
 CC subtype 3a 5'UTR that can be used in the analysis of folded structures  
 CC using the method of the invention.

DR
XX Detecting a mutation, useful in diagnosing and creating e.g. cancer or
PT hepatitis, comprises generating fragments of polynucleotides using
PT specific primers and measuring molecular weight of cleaved fragments.
XX
XX Example 4; SEQ ID NO 16; 58bp; English.
PS
XX The invention relates to detecting a mutation. The method involves
CC amplifying a target polynucleotide using a forward primer and a reverse
CC primer; generating fragments of two or more single-stranded
CC polynucleotides including one or more mutations sequence having the size
CC of 2-33 bases by cleaving the amplified target polynucleotide with
CC restriction enzymes, where the second restriction enzyme does not react
CC while a first restriction enzyme is reacted with the amplified
CC polynucleotide; and measuring the molecular weight of the cleaved
CC fragments. The polynucleotide is cleaved to include one mutation among
CC two or more different mutations in only one single stranded
CC polynucleotide fragment and all mutations in the other single stranded
CC nucleotide fragment. Restrictions enzyme treatment step is performed
CC using restriction enzymes having different optimum temperatures. The
CC method is useful in detecting a mutation. The method and primer are
CC useful in diagnosing, prognosis, creating and preventing a disease, e.g.
CC cancer or hepatitis B or C virus. The present sequence represents a HCV
CC 5' NCR (non coding region) template DNA sequence.

PT Identifying a compound that increases the mutation rate of hepatitis C virus (HCV) comprises detecting an increase in HCV quasispecies produced by the cell in the presence of the candidate compound.

PS Example 13; SEQ ID NO 13; 35pp; English.

XX The invention relates to a method for identifying a compound that  
 CC increases the mutation rate of hepatitis C virus (HCV), comprising  
 CC detecting an increase in HCV quasispecies produced by the cell in the  
 CC presence of the candidate compound by e.g. sequencing HCV nucleic acid  
 CC molecules isolated from the test cell. The method involves providing a  
 CC test cell containing a nucleic acid molecule comprising a first  
 CC nucleotide sequence consisting of an infectious hepatitis C viral genome  
 CC copy and an inducible promoter operably linked to the first and second  
 CC nucleotide sequences, where the ribozyme is configured to remove a 3'  
 CC sequence unnecessary for replication of the hepatitis C viral genome from  
 CC a transcript initiated by the promoter, inducing the inducible promoter,  
 CC contacting the test cell with a candidate compound and detecting an  
 CC increase in HCV quasispecies produced by the cell in the presence of the  
 CC candidate compound compared to that in the absence of the compound, where  
 CC an increase in the HCV quasispecies indicates that the compound increases  
 CC the mutation rate of HCV. The method is useful in identifying compounds  
 CC that may be used for treating HCV infection. This sequence represents an  
 CC HCV genomic DNA 5'UTR region used in the method of the invention.

PT Typing nucleic acid for obtaining information about several variable sites involves simultaneously or sequentially performing two or more primer extension reactions, and determining the pattern of nucleotide incorporation.

PS Example 1; Fig 2; 86pp; English.

XX The invention relates to a novel method for obtaining typing information  
 CC about several variable sites within target nucleic acid, or typing one or  
 CC more nucleic acid molecules. The methods of the invention are useful for  
 CC typing one or more nucleic acid molecules containing two or more variable  
 CC sites, preferably nucleic acid molecules containing three or more  
 CC variable sites are typed, where three or more primer extension reactions  
 CC are performed. The method is also useful for diagnosis of pathological  
 CC conditions characterized by the presence of specific nucleic acid  
 CC molecule(s). The methods are particularly suited for identifying  
 CC microbial species or their subtypes, and in typing procedures e.g. typing  
 CC of polymorphisms, tissue typing or in clinical applications. The sequence  
 CC represents the 5' untranslated region (UTR) of a hepatitis C virus (HCV)  
 CC genotype, amplified in the invention to type HCV-positive sera

PT Cleavage of nucleic acids to detect mutation(s) - allows detection esp.
PT in human p53 gene, to identify strains of microorganisms and viruses.
XX
PS Example 32; Page 301; 43pp; English.
XX
CC Cleavage of nucleic acids using an enzyme, especially a nuclease selected
CC from the group consisting of Cleavase (RTM) BN enzyme, Thermus aquaticus
CC DNA polymerase, Thermus thermophilus DNA polymerase, Escherichia coli
CC ExoIII and the Saccharomyces cerevisiae Rad1/Rad10 complex. The nucleic
CC acid substrate is preferably an oligonucleotide containing a human p53
CC gene sequence or alternatively, microbial gene sequences. Cleavage
CC products are compared to the cleavage products of reference gene
CC sequences. The method is used for detecting mutation in the human p53
CC gene; for identifying strains of microorganisms, especially bacteria
CC selected from the group of members of the genera Campylobacter,
CC Escherichia, Mycobacterium, Salmonella, Shigella and Staphylococcus. The
CC method may also be used for the identification of viruses, especially
CC hepatitis C virus (HCV) and simian immunodeficiency virus (SIV). Four
CC primers (AAT29110-113) were used to generate six DNA HCV fragments by RT-
CC PCR. The sequence described in AAT29110 is an external antisense primer.
CC The sequence described in AAT29111 is a sense primer used after
CC termination of the reverse transcription reaction. The remaining two
CC primers (AAT29112, AAT29113) were used in a second round of amplification
CC reactions which produced a 281 bp product which corresponds to a
CC conserved 5' noncoding region of HCV between positions -284 and -4 of the
CC HCV genome. The amplified sequences are described in AAT29116-121

 PT Identification of strains of microorganisms, by treating nucleic acid  
 PT cleavage structure(s) derived from microorganisms with nuclease to form  
 PT cleavage products(s) and detecting the product(s).  
 XX  
 PS Example 34; Fig 82; 303pp; English.  
 XX  
 CC The invention relates to a method of detecting and identifying strains of  
 CC microorganisms by providing a nuclease and a nucleic acid substrate  
 CC containing sequences derived from microorganism(s), treating the nucleic  
 CC acid substrate to form cleavage structure(s) and reacting the nuclease  
 CC with the cleavage structures so that cleavage product(s) are produced.  
 CC The method is used for the identification of strains of microorganisms.  
 CC The microorganism comprises bacteria including Campylobacter,  
 CC Escherichia, Mycobacterium, Salmonella, Shigella or Staphylococcus or a  
 CC virus comprising hepatitis C virus or simian immunodeficiency virus. The  
 CC Mycobacterium comprises strains of multi-drug resistant Mycobacterium  
 CC tuberculosis. The method is less sensitive to size so that entire genes,  
 CC rather than gene fragments, may be analysed. It facilitates the use of  
 CC internal standards for subsequent analysis and data comparison, and  
 CC increases the productivity of personnel and equipment. The present  
 CC sequence represents a Cleavage BN substrate DNA.

XX Treatment system for detection and characterization of nucleic acid
PT sequences and sequence changes, comprises target nucleic acid, and three
PT oligonucleotides.
XX
XX Disclosure; SEQ ID NO 126; 165bp; English.
PS
XX The invention relates to a nucleic acid treatment system which consists
CC of a target nucleic acid having first and second regions; a first
CC oligonucleotide having a 3' portion complementary to the first region,
CC and a 5' portion; a second oligonucleotide having a portion complementary
CC to the second region; and a third oligonucleotide having a portion
CC complementary to 5' portion of first oligonucleotide. The system is
CC useful for detection and characterisation of nucleic acid sequences and
CC sequence changes in microbial gene sequences. The inventive system is
CC robust. The system allows detection of and identification of bacterial
CC and viral pathogens in a sample. The present sequence represents a HCv
CC clone.

XX PT Cleavage of nucleic acids to detect mutation(s) - allows detection esp.
XX PT in human p53 gene, to identify strains of microorganisms and viruses.
XX PS Example 32; Page 301; 433pp; English.
XX CC Cleavage of nucleic acids using an enzyme, especially a nuclease selected
XX CC from the group consisting of cleavage (RTM) BN enzyme, Thermus aquaticus
XX CC DNA polymerase, Thermus thermophilus DNA polymerase, Escherichia coli
XX CC ExoIII and the Saccharomyces cerevisiae Rad1/Rad10 complex. The nucleic
XX CC acid substrate is preferably an oligonucleotide containing a human p53
XX CC gene sequence or alternatively, microbial gene sequences. Cleavage
XX CC products are compared to the cleavage products of reference gene
XX CC sequences. The method is used for detecting mutation in the human p53
XX CC gene, for identifying strains of microorganisms, especially bacteria
XX CC selected from the group of members of the genera Campylobacter,
XX CC Escherichia, Mycobacterium, Salmonella, Shigella and Staphylococcus. The
XX CC method may also be used for the identification of viruses, especially
XX CC hepatitis C virus (HCV) and simian immunodeficiency virus (SIV). Four
XX CC primers (AAT29110-113) were used to generate six DNA HCV fragments by RT-
XX CC PCR. The sequence described in AAT29110 is an external antisense primer.
XX CC The sequence described in AAT29111 is a sense primer used after
XX CC termination of the reverse transcription reaction. The remaining two
XX CC primers (AAT29112, AAT29113) were used in a second round of amplification
XX CC reactions which produced a 281 bp product which corresponds to -4 of the
XX CC conserved 5' noncoding region of HCV between positions -284 and -4 of the
XX CC HCV genome. The amplified sequences are described in AAT29116-121

 PT Detection and characterisation of nucleic acid sequences - by mixing a  
 PT folded target and one or more probes to form a probe/folded target  
 PT complex and detecting and characterising the complexes.  
 XX  
 PS Example 3; Fig 6; 279pp; English.  
 XX  
 CC The invention relates to methods and compositions of detection and  
 CC characterisation of nucleic acid sequences and sequence changes. One  
 CC method of detection and characterisation comprises: (a) providing: (i) a  
 CC folded target having a DNA sequence comprising at least 1 double stranded  
 CC region and at least 1 single stranded region; and (ii) at least 1 probe  
 CC complementary to at least a portion of the folded target; and (b) mixing  
 CC the target and probes so that the probe hybridises to form a probe  
 CC /folded target complex. Also provided are methods for determination of  
 CC structure formation in nucleic acid targets; for analysing folded nucleic  
 CC acids targets; and for analysis of nucleic acid structures. The methods  
 CC can be used for the detection and characterisation of nucleic acid  
 CC sequences to detect the presence of pathogenic nucleic acid sequences  
 CC indicative of an infection, the presence of variants or alleles of  
 CC mammalian genes associated with disease and cancers, and the  
 CC identification of the source of nucleic acids found in forensic samples,  
 CC as well as in paternity determinations. The methods allow simultaneous  
 CC analysis of both strands (e.g. the sense and antisense strands) and are  
 CC ideal for high-level multiplexing. The products produced are amenable to  
 CC qualitative, quantitative and positional analysis. The methods may be  
 CC performed in solution or in the solid phase (e.g. on a solid support).  
 CC The methods are powerful in that they allow for analysis of longer  
 CC fragments of nucleic acid than current methodologies. The present  
 CC sequence represents a hepatitis C virus (HCV) subtype 1b sequence that  
 CC can be used as a target in the hybridisation analysis using multiple  
 CC capture probes for HCV genotyping

 PT Identifying oligonucleotides hybridizing to nucleic acids containing  
 PT secondary structure, useful in clinical diagnosis, comprises identifying  
 PT primers that interact with the target to form an extension product under  
 PT amplification conditions.  
 XX  
 PS Example 3; Fig 6; 409pp; English.  
 XX  
 CC The present invention describes a method for identifying oligonucleotides  
 CC with desired hybridisation properties to nucleic acid targets containing  
 CC secondary structure. The method comprises amplifying a target nucleic  
 CC acid having at least one accessible and one inaccessible site. Primers  
 CC that form an extension product are identified as the oligonucleotides  
 CC which can interact with the folded target nucleic acid. Oligonucleotides  
 CC from the present invention can be used in novel detection methods for  
 CC clinical diagnostic purposes, including the detection and identification  
 CC of pathogenic organisms (e.g. HIV). The method allows the ability to  
 CC rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent  
 CC sequences used in the exemplification of the present invention

 PT Analyzing nucleic acids, comprises mixing target nucleic acid such as  
 PT hepatitis C virus nucleic acid, bridging oligonucleotide, second  
 PT oligonucleotide and cleavage agent to form cleavage structure.  
 XX  
 PS Example 3; SEQ ID NO 21; 143pp; English.  
 XX  
 CC The invention describes a method of analysing nucleic acids comprising  
 CC providing a target nucleic acid, e.g. hepatitis C virus nucleic acid  
 CC having non-contiguous single-stranded regions (NCSR) separated by an  
 CC intervening region, a bridging oligonucleotide capable of binding to the  
 CC first and second NCSR, a second oligonucleotide binding to a portion of  
 CC the first NCSR and a cleavage agent, and mixing the contents to form a  
 CC cleavage structure. The method is useful for analysing nucleic acids,  
 CC e.g. hepatitis C virus nucleic acid useful for clinical diagnostic  
 CC purposes and detection and identification of pathogenic microorganisms  
 CC such as hepatitis C virus. This sequence represents a hepatitis C virus  
 CC subtype 1b polynucleotide identified using the analysis methods of the  
 CC invention.

XX PT Detection and characterisation of nucleic acid sequences - by mixing a  
PT folded target and one or more probes to form a probe/folded target  
PT complex and detecting and characterising the complexes.  
XX PS Example 3; Fig 6; 279pp; English.  
XX CC The invention relates to methods and compositions of detection and  
CC characterisation of nucleic acid sequences and sequence changes. One  
CC method of detection and characterisation comprises: (a) providing: (i) a  
CC folded target having a DNA sequence comprising at least 1 double stranded  
CC region and at least 1 single stranded region; and (ii) at least 1 probe  
CC complementary to at least a portion of the folded target; and (b) mixing  
CC the target and probes so that the probe hybridises to form a probe  
CC /folded target complex. Also provided are methods for determination of  
CC structure formation in nucleic acid targets; for analysing folded nucleic  
CC acids targets; and for analysis of nucleic acid structures. The methods  
CC can be used for the detection and characterisation of nucleic acid  
CC sequences to detect the presence of pathogenic nucleic acid sequences  
CC indicative of an infection, the presence of variants or alleles of  
CC mammalian genes associated with disease and cancers, and the  
CC identification of the source of nucleic acids found in forensic samples,  
CC as well as in paternity determinations. The methods allow simultaneous  
CC analysis of both strands (e.g. the sense and antisense strands) and are  
CC ideal for high-level multiplexing. The products produced are amenable to  
CC qualitative, quantitative and positional analysis. The methods may be  
CC performed in solution or in the solid phase (e.g. on a solid support).  
CC The methods are powerful in that they allow for analysis of longer  
CC fragments of nucleic acid than current methodologies. The present  
CC sequence represents a hepatitis C virus (HCV) subtype 3a sequence that  
CC can be used as a target in the hybridisation analysis using multiple  
CC capture probes for HCV genotyping

 XX Preparation of RNA samples from plasma - by alcohol precipitation after  
 PT lysis with guanidinium thiocyanate.  
 PT  
 XX Disclosure; Fig 22; 60pp; English.  
 PS  
 XX This DNA sequence comprises an RT-PCR amplification product of hepatitis  
 CC C virus RNA recovered from plasma. A claimed method for preparing RNA  
 CC samples comprises: (a) mixing plasma with an aqueous buffer solution  
 CC containing guanidinium thiocyanate and beta- mercaptoethanol; (b) heating  
 CC the mixture; (c) adding an equal volume of an alcohol to precipitate RNA;  
 CC and (d) recovering the RNA. The method can be used to prepare RNA samples  
 CC for subsequent amplification, especially for detecting pathogens, e.g.  
 CC HCV or HIV. Compared with the known "Isoquick" and "RNAzol" methods,  
 CC the method uses fewer tubes (just one), requires fewer steps, takes less  
 CC time and produces no toxic waste. (Updated on 25-MAR-2003 to correct PF  
 CC field.)

XX
XX   Typing nucleic acid for obtaining information about several variable
PT   sites involves simultaneously or sequentially performing two or more
PT   primer extension reactions, and determining the pattern of nucleotide
PT   incorporation.
XX
XX   Example 1; Fig 2; 86pp; English.
XX
XX   The invention relates to a novel method for obtaining typing information
CC   about several variable sites within target nucleic acid, or typing one or
CC   more nucleic acid molecules. The methods of the invention are useful for
CC   typing one or more nucleic acid molecules containing two or more variable
CC   sites, preferably nucleic acid molecules containing three or more
CC   variable sites are typed, where three or more primer extension reactions
CC   are performed. The method is also useful for diagnosis of pathological
CC   conditions characterized by the presence of specific nucleic acid
CC   molecule(s). The methods are particularly suited for identifying
CC   microbial species or their subtypes, and in typing procedures e.g. typing
CC   of polymorphisms, tissue typing or in clinical applications. The sequence
CC   represents the 5' untranslated region (UTR) of a hepatitis C virus (HCV)
CC   genotype, amplified in the invention to type HCV-positive sera

PT Synthetic oligonucleotides complementary to a portion of the 5'  
 PT untranslated region of hepatitis C virus (HCV), useful for diagnosing and  
 PT treating HCV infections and hepatocellular carcinoma.

PS Disclosure; Fig 1; 74pp; English.

CC The invention describes synthetic oligonucleotides complementary to a  
 CC portion of the 5' untranslated region of hepatitis C virus. The  
 CC oligonucleotides may be used in methods for controlling, preventing, and  
 CC treating hepatitis C virus infection, in antisense technology and gene  
 CC therapy, and of detecting the presence of hepatitis C virus in a sample.  
 CC Hepatitis C virus (HCV) is an enveloped, positive sense, single-stranded  
 CC RNA virus which infects hepatocytes. HCV is the major cause of non-A, non  
 CC -B, acute and chronic hepatitis, and has been associated with  
 CC hepatocellular carcinoma. The invention describes methods and kits for

CC inhibiting replication of HCV, inhibiting the expression of HCV nucleic  
CC acid and protein, and for treating HCV infections. This sequence  
CC represents a hepatitis C virus polynucleotide used as the target for  
CC inhibition of HCV replication and gene expression using the synthetic  
CC oligonucleotides of the invention

PT Novel composition comprising a hepatitis C virus antisense polynucleotide  
PT which is complementary to or corresponds to a sense strand of the virus  
PT genome, and selectively hybridizes to it.  
XX  
PS Example; Fig 14; 75pp; English.  
XX  
CC The specification describes a pharmaceutical composition which comprises  
CC a hepatitis C virus (HCV) antisense polynucleotide. The HCV is  
CC characterized by a positive stranded RNA genome which has 40% homology at  
CC the polypeptide level to a HCV polypeptide. The antisense polynucleotide  
CC binds to cellular polynucleotides which enhance and/or are required for  
CC viral infectivity, replicative ability or chronicity. The antisense  
CC polynucleotides may also be designed to bind with high specificity, to be  
CC of increased stability, to be stable and to have low toxicity. The  
CC composition also comprises an agent which causes viral RNA to be  
CC inactive. The composition is used for preventing HCV replication in a  
CC system. The present sequence represents a novel HCV cDNA sequence, which  
CC is used in the course of the invention

 PT inhibiting infection by HCV of and/or replication of HCV in cells of  
 PT central nervous system.  
 XX  
 XX Example 1; Fig 14; 145pp; English.  
 PS  
 CC The present invention relates to a method of treating a patient with or  
 CC at risk of hepatitis C virus (HCV) infection. The method comprises  
 CC inhibiting infection by HCV of, and/or replication of HCV in cells of the  
 CC central nervous system (CNS) of the patient. The method is performed by  
 CC administering to the central nervous system (CNS) a compound capable of  
 CC inhibiting HCV infection and/or replication in the CNS of the patient  
 CC e.g. in monocytes or cells of monocytic lineage. The method is useful for  
 CC treating a patient with or at risk of HCV infection by inhibiting HCV  
 CC infection of and/or replication in cells and non-CNS cells. Preferably,  
 CC HCV infection of and/or replication in microglial cells or circulating  
 CC microglial cell precursors is inhibited. The method is carried out in a  
 CC patient who is, has been or will be administered alpha-interferon. Use of  
 CC a pharmacological agent that blocks binding of the brain-specific  
 CC envelope protein to the putative receptor prevents uptake of the virus to  
 CC the CNS, and improves long-term response rates. Reinfection of the liver  
 CC by the virus released by the CNS may be prevented by the above mentioned  
 CC method. The development of resistant strains is reduced or prevented. By  
 CC the therapeutic use of a vaccine against brain-specific envelope protein,  
 CC before, together with or after antiviral therapy. ABK70867-ABK70886  
 CC represent HCV genome 5'UTR sequences derived from HCV infected patient  
 CC BU. Note: Fig 14 page 6 of 6 (page 19/19) is in the incorrect position in  
 CC the Fig, and should be page 4 of 6 as the nucleotide numbering of the  
 CC sequences on this page follow correctly from page 3 of 6 (page 16/19).  
 CC All sequences in Fig 14 have been typed in according to their correct  
 CC nucleotide positioning

PT Treating patient with or at risk of hepatitis C virus (HCV) infection by  
PT inhibiting infection by HCV of and/or replication of HCV in cells of  
PT central nervous system.  
XX  
PS Example 1; Fig 14; 145pp; English.  
XX  
CC The present invention relates to a method of treating a patient with or  
CC at risk of hepatitis C virus (HCV) infection. The method comprises

CC inhibiting infection by HCV of, and/or replication of HCV in cells of the  
CC central nervous system (CNS) of the patient. The method is performed by  
CC administering to the central nervous system (CNS) a compound capable of  
CC inhibiting HCV infection and/or replication in the CNS of the patient  
CC e.g. in monocytes or cells of monocytic lineage. The method is useful for  
CC treating a patient with or at risk of HCV infection by inhibiting HCV  
CC infection of and/or replication in cells and non-CNS cells. Preferably,  
CC microglial cell precursors is inhibited. The method is carried out in a  
CC patient who is, has been or will be administered alpha-interferon. Use of  
CC a pharmacological agent that blocks binding of the brain-specific  
CC envelope protein to the putative receptor prevents uptake of the virus to  
CC the CNS, and improves long-term response rates. Reinfection of the liver  
CC by the virus released by the CNS may be prevented by the above mentioned  
CC method. The development of resistant strains is reduced or prevented, by  
CC the therapeutic use of a vaccine against brain-specific envelope protein,  
CC before, together with or after antiviral therapy. ABK70867-ABK70886

PT In vitro screening for antiviral agents, from ability to inhibit complex  
PT formation between the p110 subunit of translation initiation factor eIF3  
PT and region II of the viral internal ribosome binding site.

PS Example 1; SEQ ID NO 1; 45pp; French.

CC The present invention relates to an in vitro method of screening for  
CC compounds (A) that inhibit the formation of a complex between the p10  
CC subunit (ADP20412) of the eukaryotic translation initiation factor eIF3  
CC and region II of the internal ribosome entry site (IRES; ADP20411) of  
CC hepatitis C virus (HCV). Preferably the p10 recognition motif (ADP20414)  
CC and the region II consensus sequence (ADP20412), or fragment of it  
CC containing at least 8 consecutive nucleotides, are used. (A) is  
CC especially an aminoglycoside, specifically tobramycin or an  
CC oligonucleotide antisense to consensus sequence ADP20412, or parts of it.  
CC (A) are used for treating infection by hepatitis C, swine fever and  
CC bovine diarrhoea viruses, also for treating viral or non-viral diseases  
CC which involve proteins synthesis of which is initiated from an IRES, e.g.  
CC cancer. The present sequence is the full-length HCV IRES sequence.

PT Chimeric viral RNA, used in vaccine against BVDV.  
XX  
PS Disclosure; Fig 15; 108pp; English.  
XX  
CC The present sequence represents an adapted Hepatitis C virus (HCV) 5' non  
CC translated region (NTR) from a virus of the invention. Only the sequence  
CC from the 5' base to the ATG initiating the polypeptide is shown. The  
CC specification describes chimeric viral RNA comprising a 5' nontranslated  
CC region (5'NTR); an open reading frame (ORF) region; and a 3' NTR; where  
CC at least one of the regions is chimeric and comprises a nucleotide  
CC sequence from a pestivirus in operable linkage with a heterologous  
CC nucleotide sequence, preferably from HCV. The chimeric viral RNA is  
CC replication-competent. The chimeric viral RNA can be used in a method for  
CC identifying compounds having antiviral activity against HCV. When the  
CC pestivirus viral nucleotide sequence is from bovine viral diarrhoea virus  
CC (BVDV), the chimeric viral RNA can be used in a vaccine against BVDV

XX Identifying a test compound that binds to a target RNA molecule for  
PT treating or preventing amyloidosis, hemophilia, cancer, gigantism,  
PT diabetes, by contacting a detectably labeled target RNA molecule with a  
PT library of test compounds.  
XX  
XX Example; Page 68; 152pp; English.  
XX  
XX The invention relates to a method for identifying a test compound that  
CC binds to a target RNA molecule, which comprises contacting a detectably  
CC labeled target RNA molecule with a library of test compounds under  
CC conditions that permit direct binding of the labelled target RNA to a  
CC member of the library of test compounds so that a detectably labeled

CC target RNA: test compound complex is formed. The method is useful for  
CC screening libraries of compounds for those that are selectively bind to a  
CC pre-selected target RNA. The compounds are useful for inhibiting the  
CC formation of a specific bound RNA: host cell factor complexes in vivo.  
CC They are also useful for treating or preventing diseases associated with  
CC overproduction or decreased protein function, such as amyloidosis,  
CC haemophilia, Alzheimer's disease, atherosclerosis, cancer, gigantism,  
CC inflammation, hypothyroidism, hyperthyroidism, autoimmune disorders, aging,  
CC dwarfism, cystic fibrosis, diabetes, obesity, neurodegenerative  
CC disorders, Parkinson's disease or infections (bacterial, viral, fungal).  
CC The invention is also used in gene therapy. The present sequence is human  
CC internal ribosome entry site (IRES) RNA. This sequence is used to  
CC illustrate the method of the invention

PT inhibiting infection by HCV of and/or replication of HCV in cells of  
PT central nervous system.  
XX  
XX Example 1; Fig 14; 145pp; English.  
XX  
XX The present invention relates to a method of treating a patient with or  
CC at risk of hepatitis C virus (HCV) infection. The method comprises  
CC inhibiting infection by HCV of, and/or replication of HCV in cells of the  
CC central nervous system (CNS) of the patient. The method is performed by  
CC administering to the central nervous system (CNS) a compound capable of  
CC inhibiting HCV infection and/or replication in the CNS of the patient  
CC e.g. in monocytes or cells of monocytic lineage. The method is useful for  
CC treating a patient with or at risk of HCV infection by inhibiting HCV  
CC infection of and/or replication in cells and non-CNS cells. Preferably,  
CC HCV infection of and/or replication in microglial cells or circulating  
CC microglial cell precursors is inhibited. The method is carried out in a  
CC patient who is, has been or will be administered alpha-interferon. Use of

CC a pharmacological agent that blocks binding of the brain-specific  
CC envelope protein to the putative receptor prevents uptake of the virus to  
CC the CNS, and improves long-term response rates. Re-infection of the liver  
CC by the virus released by the CNS may be prevented by the above mentioned  
CC method. The development of resistant strains is reduced or prevented, by  
CC the therapeutic use of a vaccine against brain-specific envelope protein,  
CC before, together with or after antiviral therapy. ABK70867-ABK70866  
CC represent HCV genome 5'UTR sequences derived from HCV infected patient

PS  
XX  
XX The primers AAQ98270-94 are used in a novel simple method for the  
CC detection of hepatitis C virus. The novel method involves the steps of  
CC extracting the virus from a sample, synthesising cDNA from the viral RNA  
CC by reverse transcription, amplifying the cDNA by a first PCR and  
CC reamplifying the amplified product in a second PCR, all of which occur in  
CC a single reaction tube. The primers are designed based on a 334 bp  
CC sequence (AAQ98272) derived from a 5' non-translated region of the viral  
CC genome

PS Example 1; Fig 14; 145pp; English.  
XX  
XX The present invention relates to a method of treating a patient with or  
CC at risk of hepatitis C virus (HCV) infection. The method comprises  
CC inhibiting infection by HCV of, and/or replication of HCV in cells of the  
CC central nervous system (CNS) of the patient. The method is performed by  
CC administering to the central nervous system (CNS) a compound capable of  
CC inhibiting HCV infection and/or replication in the CNS of the patient  
CC e.g. in monocytes or cells of monocytic lineage. The method is useful for  
CC treating a patient with or at risk of HCV infection by inhibiting HCV  
CC infection of and/or replication in cells and non-CNS cells. Preferably,  
CC HCV infection of and/or replication in microglial cells or circulating  
CC microglial cell precursors is inhibited. The method is carried out in a  
CC patient who is, has been or will be administered alpha-interferon. Use of  
CC a pharmacological agent that blocks binding of the brain-specific  
CC envelope protein to the putative receptor prevents uptake of the virus to  
CC the CNS, and improves long-term response rates. Reinfection of the virus to  
CC by the virus released by the CNS may be prevented by the above mentioned  
CC method. The development of resistant strains is reduced or prevented, by  
CC the therapeutic use of a vaccine against brain-specific envelope protein,  
CC before, together with or after antiviral therapy. ABK70867-ABK70886  
CC represent HCV genome 5'UTR sequences derived from HCV infected patient  
CC BU. Note: Fig 14 page 6 of 6 (page 19/19) is in the incorrect position in  
CC the Fig, and should be page 4 of 6 as the nucleotide numbering of the  
CC sequences on this page follow correctly from page 3 of 6 (page 16/19).  
CC All sequences in Fig 14 have been typed in according to their correct  
CC nucleotide positioning

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

 Seeds were surface sterilized then germinated under aseptic  
 conditions in the dark at room temperature on filter paper  
 with water, nystatin and cefotaxime in covered  
 crystallization dishes. Five-day old seedlings were  
 incubated at 50C for 2 days. Shoots were then harvested,  
 total RNA was prepared, poly(A) RNA was purified, one  
 primary unamplified cDNA library was made, and 600000 pfu  
 were in vivo excised to give plasmid SK(-) cDNA  
 phagemids. These steps were performed in the TU Close  
 Laboratory at the University of California, Riverside  
 (Choi, Close, Fenton). Phagemids were plated and picked at  
 the Clemson University Genomics Institute (CUGI) (Begum,  
 Palmer, Friesch, Atkins and Wing). Plasmid DNA  
 preparations, DNA sequencing and sequence analysis were  
 performed at CUGI (Wing, Yu, Friesch, Henry, Simmons,  
 Oates, Rambo, Main). The sequence has been trimmed to  
 remove vector sequence and contains a minimum of 100 bases  
 of phred value 20 or above. For more details on library  
 preparation and sequence analysis see  
 http://www.genome.clemson.edu/projects/barley. To order  
 this clone see http://www.genome.clemson.edu/orders also  
 see Close.TU, Wing.R., Kleinhofs.A., Wise.R. (2001)  
 Genetically and physically anchored EST resources for  
 barley genomics. Barley Genetics Newsletter 31:29-30.

one year old clonal trees grown under greenhouse  
conditions in standard potting soil mixture; Vector:  
pBluescript II SK (+) XR; Site\_1: EcoRI (5' end of cDNA) ;  
Site\_2: XhoI (3' end of cDNA) ; Bark was wounded using  
razor blades along the entire length of the tree at 5 mm  
intervals on opposite sides of the trunk. The same trees  
were also sprayed with a 0.01% (v/v) methyl jamonate  
solution resuspended in 0.1% (v/v) tween 20 (~50mls per  
tree). Bark tissue with phloem attached was harvested 3

hours, 6 hours, 12 hours, 24 hours, 2 days, 4 days and 8 days after initiating the treatment. Untreated control dark was also harvested at time 0 hours. mRNA was isolated from each tissue source independently and equal quantities of mRNA from each tissue were then pooled. cDNA was prepared from 5 micrograms of mRNA and directionally ligated into the pBluescript II SK (+) XR vector using the pBluescript II XR cDNA Library Construction Kit according to manufacturer's instructions with modifications (Stratagene). Plasmid DNA was then transformed by electroporation into DH10B cells (Invitrogen) for propagation. Normalization was applied according to published methods [Bonaldo M.F. et al. (1996) Genome Research 6(9):791] in order to reduce the abundance of highly expressed transcripts."

Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified  
using Dynabeads (Dyna1) and mRNA eluted for first strand synthesis.  
First strand cDNA was created using MMLV RT (Powerscript, Clontech)  
and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added  
using chimeric DNA-RNA oligo. 12 PCR cycles were done using first  
strand and primers specific to SMART oligo and 3' end. Double  
stranded cDNA was digested using XhoI/NotI, fractionated on  
Chroma-spin 400 columns (Clontech) and ligated to digested  
pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as  
host cells. Library materials provided by Dr. David Bird of North  
Carolina State University. Library construction by Jeff Rousch. See  
www.nematode.net for additional project information.

/note="Vector: PMD42nv; Purified genomic DNA from M. musculus C57BL/6J (male) was obtained from the Jackson Laboratory Mouse DNA Resource

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a

0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4

polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The

adaptor DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel

electrophoresis. Vector DNA was prepared from a derivative of PMD42 (g1473214[g1473214]AF129072.1), a copy-number

inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and

purified. The sheared, adaptor mouse DNA was annealed to adaptor vector DNA, and transformed into

chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified using Dynabeads (Dynal) and mRNA eluted for first strand synthesis. First strand cDNA was created using MMLV RT (Powerscript, Clontech) and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added using chimeric DNA-RNA oligo. 12 PCR cycles were done using first strand and primers specific to SMART oligo and 3' end. Double stranded cDNA was digested using XhoI/NotI, fractionated on Chroma-spin 400 columns (Clontech) and ligated to digested pGEM-11ze(+) plasmid. Chemically competent DH10B cells were used as host cells. Library materials provided by Dr. David Bird of North Carolina State University. Library construction by Jeff Rousch. /note="Organ: Bark (with phloem and cambium attached) from one year old clonal trees grown under greenhouse conditions in standard potting soil mixture; Vector: Bluescript II SK (+) XR; Site: 1: EcoRI (5' end of cDNA); Site 2: XhoI (3' end of cDNA); Bark was wounded using razor blades along the entire length of the tree at 5 mm intervals on opposite sides of the trunk. The same trees were also sprayed with a 0.01% (v/v) methyl jasmonate solution resuspended in 0.1% (v/v) tween 20 (50mls per tree). Bark tissue with phloem attached was harvested 3 hours, 6 hours, 12 hours, 24 hours, 2 days, 4 days and 8 days after initiating the treatment. Untreated control bark was also harvested at time 0 hours. mRNA was isolated from each tissue source independently and equal quantities of RNA from each tissue were then pooled. cDNA was prepared from 5 micrograms of mRNA and directionally ligated into the Bluescript II SK (+) XR vector using the phluescript II XR cDNA Library Construction Kit according to manufacturer's instructions with modifications (Stratagene). Plasmid DNA was then transformed by electroporation into DH10B cells (Invitrogen) for propagation. Normalization was applied according to published methods [Bonaldi M.F. et al. (1996) Genome Research 6(9):791] in order to reduce the abundance of highly expressed transcripts."

/note="Organ: Bark (with phloem and cambium attached) from one year old clonal trees grown under greenhouse conditions in standard potting soil mixture; Vector: pBluescript II SK (+) XR; Site 1: EcoRI (5' end of cDNA); Site 2: XhoI (3' end of cDNA); Bark was wounded using razor blades along the entire length of the tree at 5 mm intervals on opposite sides of the trunk. The same trees were also sprayed with a 0.01% (v/v) methyl jasmonate solution resuspended in 0.1% (v/v) tween 20 (~50mls per tree). Bark tissue with phloem attached was harvested 3 hours, 6 hours, 12 hours, 24 hours, 2 days, 4 days and 8 days after initiating the treatment. Untreated control bark was also harvested at time 0 hours. mRNA was isolated from each tissue source independently and equal quantities of mRNA from each tissue were then pooled. cDNA was prepared from 5 micrograms of mRNA and directionally ligated into the pBluescript II SK (+) XR vector using the pBluescript II XR cDNA Library Construction Kit according to manufacturer's instructions with modifications (Stratagene). Plasmid DNA was then transformed by electroporation into DH10B cells (Invitrogen) for published methods [Bonaldo M.F. et al. (1996) Genome Research 6(9):791] in order to reduce the abundance of highly expressed transcripts."

/clone\_lib="zmrw848"  
/note="Samples were collected in Robert E. Sharp's lab (University of Missouri-Columbia) to construct three normalized cDNA libraries. Dark-grown maize seedlings with primary roots 12-20 mm in length were transplanted to high (-0.03 MPa) or low water potential (-1.6 MPa) vermiculite, and harvested at 5 h and 48 h after transplanting. About 1,000 roots were used for each of the low water potential libraries (zmrw805 and zmrw848) while 500 roots were combined from each of the two time points at high water potential (zmrw00). Each root was divided into 4 segments (distances are from the junction of the root apex and root cap): segment 1, 0-3 mm plus the root cap; segment 2, 3-7 mm; segment 3, 7-12 mm; segment 4, 12-20 mm. (For details of conditions see (1) with nutrient modifications as in (2)). The three normalized cDNA libraries were constructed in the lab of Hans Bohnert (University of Illinois-UC). Total RNA was extracted by the 'hot phenol' method (Plant Molecular Biology manual, D5: 1-13, 2nd ed., 1997). This method worked in eliminating carbohydrate material present in the root tips. The integrity of the RNA was verified by denaturing agarose gels and spectrophotometry (ratio A260/280). Poly(A)+mRNA was isolated twice from total RNA using the Oligotex Direct mRNA kit (Qiagen). Poly(A)+mRNA was converted to double-stranded cDNA and tagged by using modified Oligo(dT) primers. One of 4 sequence tags corresponding to a different segment of the root was added to the 3'-end of the modified Oligo(dT) primers, including a NotI site and used to reverse transcribe the segment-specific mRNAs into cDNAs. Each library contains all four tags. A suffix (s1, s2, s3, or s4) has been added to each sequence identifier to designate which region of the root (Root segment 1, 2, 3, or 4) the sequence was found in based on the identification of the tag. A suffix of s0 indicates that the sequence tag, and hence the source segment, could not be identified. The double stranded cDNAs were size-selected (>450 bp). Size selected cDNAs were adapted with EcoRI adaptors at both ends, and then digested with NotI. The cDNA was directionally cloned into EcoRI-NotI digested pBS II SK(+) phagemid vector (Stratagene) and electroporated into E.coli DH10B. The total number of white colony forming units (cfu) in the primary libraries before amplification was as follows: zmrw805: 3.37 x 10<sup>6</sup>; zmrw848: 4.87 x 10<sup>6</sup>; zmrw00: 3 x 10<sup>6</sup>. The background of empty clones was less than 1%. Inserts ranged from -0.5 kb to >2.5 kb, as determined by PCR. Plasmid DNA from the primary libraries then was converted to single-stranded circles and used as a template for PCR amplification using the T7 and T3 priming sites that flank the cloned cDNA inserts. The purified PCR products, representing the entire cDNA population cloned in each library, were used as a driver for normalization. Hybridization between the single-stranded library and the PCR products was carried out for 44 hours at 300C. Non-hybridized single-stranded DNA circles were separated from hybridized DNA rendered partially double-stranded and electroporated into DH10B. The total number of clones with insert was: zmrw805: 2.0x10<sup>7</sup>; zmrw848: 4.2x10<sup>7</sup>; zmrw00: 1.1x10<sup>7</sup>. The background of empty clones was less than 2%. Insert size, determined by PCR of the entire library, ranged from 0.5 kb to 2.5 kb. (1) Sharp R E, Silk W K, Heiao T C. Growth of the Maize Primary Root at Low Water Potentials I. Spatial Distribution of Expansive Growth. Plant Physiology (Rockville). 87(1). 1988. 50-57. (2) Spoilen W G, Lehnoble M E, Samuels T D, Bernstein N, Sharp

/note="Vector: pMD22nv; Purified genomic DNA from M. musculus C57BL/6J (male) was obtained from the Jackson Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrolytically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptor DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMD22 (GI14732114|GB|AF129072.1), a copy-number

inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent *E. coli* XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

        Kalamalka Research Station in Vernon, British Columbia in
        2001; Vector: pBluescript II SK (+) XR; Site: 1: EcoRI (5'
        end of cDNA); Site: 2: XhoI (3' end of cDNA); mRNA was
        isolated from each tissue source independently and equal
        quantities of mRNA from each tissue were then pooled; cDNA
        was prepared from 5 micrograms of mRNA and directionally

```

```

  ligated into the pBluescript II SK (+) XR vector using the
  pBluescript II XR cDNA library Construction kit according
  to manufacturer's instructions with modifications
  (Stratagene). Plasmid DNA was then transformed by
  electroporation into DH10B cells (Invitrogen) for
  propagation."

/note="Vector: pBRCDNA5flab: The library was constructed from 11 different sources of RNA from a single genotype. Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library construction can be obtained at http://cgpdb.ucdavis.edu/

 Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified using Dynabeads (Dyna) and mRNA eluted for first strand synthesis. First strand cDNA was created using MMLV RT (PowerScript, Clontech) and primed with oligo(dT) with XhoI site and 5' SMART 'anchor' added using chimeric DNA-RNA oligo. 12 PCR cycles were done using first strand and primers specific to SMART oligo and 3' end. Double stranded cDNA was digested using XhoI/NotI, fractionated on Chroma-spin 400 columns (Clontech) and ligated to digested pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as host cells. Library materials provided by Dr. David Bird of North Carolina State University. Library construction by Jeff Rousch. See [www.nematode.net](http://www.nematode.net) for additional project information.

Cloned unidirectionally. Poly(A) + RNA was concentrated and purified  
using Dynabeads (Dyna) and mRNA eluted for first strand synthesis.  
First strand cDNA was created using MMLV RT (Powerscript, Clontech)  
and primed with oligo(dT) with XhoI site and 5' SMART 'anchor' added  
using chimeric DNA-RNA oligo. 12 PCR cycles were done using first  
strand and primers specific to SMART oligo and 3' end. Double  
stranded cDNA was digested using XhoI/NotI, fractionated on  
Chroma-spin 400 columns (Clontech) and ligated to digested  
pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as  
host cells. Library materials provided by Dr. David Bird of North  
Carolina State University. Library construction by Jeff Rousch. See  
www.nematode.net for additional project information.  
Seq primer: Sp6.

 Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified using Dynabeads (Dyna) and mRNA eluted for first strand synthesis. First strand cDNA was created using MMLV RT (Powerscript, Clontech) and primed with oligo(dT) with XhoI site and 5' SMART 'anchor' added using chimeric DNA-RNA oligo. 12 PCR cycles were done using first strand and primers specific to SMART oligo and 3' end. Double stranded cDNA was digested using XhoI/NotI, fractionated on Chroma-spin 400 columns (Clontech) and ligated to digested pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as host cells. Library materials provided by Dr. David Bird of North Carolina State University. Library construction by Jeff Rousch. See www.nematode.net for additional project information. Seq primer: SP6.

RNA prepared and library constructed by W. Walter Lorenz, School of Forestry, University of Georgia; plant material prepared at the University of Florida; sequencing done in the Laboratory for Genomics and Bioinformatics, University of Georgia. Sequence ends have been trimmed to exclude vector and regions below Phred quality 16. Three-prime sequences are presented as their reverse complement and have been trimmed to exclude polyA.  
Seq primer: JENREV (CAGGAACAGCTATGACC).

 RNA prepared and library constructed by W. Walter Lorenz (School of Forest Resources, University of Georgia); plant material prepared by Craig Zimmermann (School of Forest Resources, University of

Georgia) using rooted cuttings provided by the Forest Biology Research Cooperative (FBRC) and the CLONES project at the University of Florida; sequencing done in the Laboratory for Genomics and Bioinformatics, University of Georgia. Sequence ends have been trimmed to exclude vector and regions below phred quality 16. Three-prime sequences are presented as their reverse complement and have been trimmed to exclude polyA.  
 Seq primer: JENREV (GAGGAACGCTATGAC).

 /note="Organ: Root; Vector: pSL1180; Site 1: EcoRI; Site 2: XhoI; The library was prepared from polyA+ RNA from the roots of 1-year-old loblolly pine (Pinus taeda) cuttings that were rooted and then planted in washed sand. The rooted cuttings were maintained for 117 days (July 2003 harvest) under ambient conditions in a local greenhouse. They were kept on a weekly regimen of 0.5x nutrient-complete Hoagland's solution and supplemented with additional water sufficient to maintain a 15% soil moisture content. For twenty-eight days (28 d) prior to harvesting roots for mRNA preparation, the trees received Hoagland's solution lacking potassium (K) to induce a potassium-deficiency. Double-stranded cDNA was cloned unidirectionally into pSL1180. Inserts can be excised with EcoRI (5' end) and XhoI (3' end)."

Site 1: SfiI (ggccgctggc); Site 2: SfiI  
(ggccatcggc); Double-stranded cDNA was prepared from  
cell line RNA. 5' and 3' adaptors were used in cloning as  
follows: 5' adaptor sequence: 5'-CACGCCATTATGGC-3' and  
3' adaptor sequence:  
5'-ATTAGAGCGCGCGCGCATG-dt(30)BN-3' (where B = A,  
C, or G and N = A, C, G, or T) Average insert size  
1.65 kb (range 0.9-4.0 kb). 14/15 clones contained  
inserts by PCR. This library was enriched for full-length  
clones and was constructed by Clontech Laboratories (Palo  
Alto, CA)."

Clones are derived from the chimpanzee BAC library PTB This BAC end

was generated during the R&D process and may have higher chance of

clone cracking errors.

/note="Vector: pBluescript II KS(+); Site 1: EcoRI;

Site 2: NotI. This normalized library was constructed from

1 million independent clones. cDNA synthesis was initiated

using an oligo(dT) primer, using methylated C in the first

strand synthesis reaction. Following this first strand

reaction, double-stranded cDNA was blunted, ligated to

NotI adapters, digested with EcoRI, size-selected, and

cloned into the NotI and EcoRI compatible sites of a

custom modified MCS of the pBluescript (KS+) vector. The

library was normalized in 2 rounds using conditions

adapted from Soares et al., PNAS (1994) 91: 9228-9232 and

Bonaldo et al., Genome Research 6 (1996): 791, except that

a significantly longer reannealing hybridization was

used."

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

US-09-402-618B-128  
; Sequence 128, Application US/09402618B  
; Patent No. 6709815

GENERAL INFORMATION:

APPLICANT: Dong, Fang

APPLICANT: Lyamichev, Victor

APPLICANT: Prudent, James

APPLICANT: Fors, Lance

APPLICANT: Neri, Bruce

APPLICANT: Brow, Mary Ann

APPLICANT: Anderson, Todd

APPLICANT: Dahlberg, James

TITLE OF INVENTION: Target-Dependent Reactions Using Structure-Bridging Oligonucleotides

FILE REFERENCE: FORS-04012

CURRENT APPLICATION NUMBER: US/09/402,618B

CURRENT FILING DATE: 2000-07-18

PRIOR APPLICATION NUMBER: PCT/US98/03194

PRIOR FILING DATE: 1998-05-05

NUMBER OF SEQ ID NOS: 128

SOFTWARE: PatentIn version 3.0

SEQ ID NO 128

LENGTH: 244

TYPE: DNA

ORGANISM: Hepatitis C virus

US-09-402-618B-128

Query Match 100.0%; Score 20; DB 4; Length 244;  
Best Local Similarity 80.0%; Pred. No. 0.0029;  
Matches 16; Conservative 4; Mismatches 0; Indels 0; Gaps 0;

Patent No. 6071693  
GENERAL INFORMATION:  
APPLICANT: Tai-An Cha  
TITLE OF INVENTION: HCV GENOMIC SEQUENCES FOR  
TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS  
NUMBER OF SEQUENCES: 147  
CORRESPONDENCE ADDRESS:  
ADDRESSEE: Wolf, Greenfield & Sacks, P.C.  
STREET: 600 Atlantic Avenue  
CITY: Boston  
STATE: Massachusetts  
COUNTRY: USA  
ZIP: 02210  
COMPUTER READABLE FORM:  
MEDIUM TYPE: Diskette, 5.25 inch  
COMPUTER: IBM compatible  
OPERATING SYSTEM: MS-DOS Version 3.3  
SOFTWARE: WordPerfect 5.1  
CURRENT APPLICATION DATA:  
APPLICATION NUMBER: US/08/441,971  
FILING DATE: 16-MAY-1995  
CLASSIFICATION: 435  
PRIOR APPLICATION DATA:  
APPLICATION NUMBER: US/08/221,653  
FILING DATE:  
APPLICATION NUMBER: US/07/881,528  
FILING DATE:  
APPLICATION NUMBER: 07/697,326  
FILING DATE: 8 May 1991  
ATTORNEY/AGENT INFORMATION:  
NAME: Janiuk, Anthony J.  
REGISTRATION NUMBER: 29,809  
REFERENCE/DOCKET NUMBER: C0772/7000  
TELECOMMUNICATION INFORMATION:  
TELEPHONE: (617) 720-3500  
TELEFAX: (617) 720-2441  
TELEX: EZEKIEL  
INFORMATION FOR SEQ ID NO: 36:  
SEQUENCE CHARACTERISTICS:  
LENGTH: 252 nucleotides  
TYPE: nucleic acid  
STRANDEDNESS: single  
TOPOLOGY: linear  
MOLECULE TYPE: DNA  
ORIGINAL SOURCE:  
INDIVIDUAL ISOLATE: sp2  
US-08-441-971-36

Query Match 100.0%; Score 20; DB 3; Length 252;  
Best Local Similarity 100.0%; Pred. No. 0.0029;  
Matches 20; Conservative 0; Mismatches 0; Indels 0; Gaps 0;

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

US-09-825-574-21/c  
; Sequence 21, Application US/09825574  
; Patent No. US20020119454A1

GENERAL INFORMATION:

APPLICANT: Lyamichev, Victor I.

Brow, Mary Ann D.

Fors, Lance

Neri, Bruce P.

TITLE OF INVENTION: Polymorphism Analysis By Nucleic Acid

Structure Probing With Structure-Bridging

Oligonucleotides.

NUMBER OF SEQUENCES: 51

CORRESPONDENCE ADDRESS:

ADDRESSEE: MEDLEN & CARROLL, LLP

STREET: 220 Montgomery Street, Suite 2200

CITY: San Francisco

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

----- Project Information
Center project name: L8785
Center clone name: 338_I_9

* NOTE: This record contains 76 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.

The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicated order and orientation of each sequence contig has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8X average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associated with a Phrap-derived quality score.

#### ----- Summary Statistics -----

Sequencing vector: plasmid; n/a; 100% of reads  
 Chemistry: Dye-terminator Big Dye; 100% of reads  
 Assembly program: Phrap; version 0.990319  
 Consensus quality: 183467 bases at least Q40  
 Consensus quality: 183739 bases at least Q30  
 Consensus quality: 183840 bases at least Q20  
 Insert size: 14400; agarose-fp  
 Insert size: 183928; sum-of-contigs  
 Quality coverage: 16.21x in Q20 bases; agarose-fp  
 Quality coverage: 12.69x in Q20 bases; sum-of-contigs

\* NOTE: This is a 'working draft' sequence. It currently consists of 8 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have been provided by the submitter.

\* This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

Project Information  
Center project name: L10217  
Center clone name: 537\_I\_16

NOTE: This record contains 278 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

1 728: contig of 728 bp in length  
\* 729 828: gap of 100 bp  
\* 829 1559: contig of 731 bp in length  
\* 1560 2382: gap of 100 bp

----- Project Information  
Center project name: L24474

Center clone name: 320\_J\_5

NOTE: This record contains 77 individual sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will be preserved.

Center clone name: 101\_A\_12

\* NOTE: This record contains 87 individual

\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allow  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

Rat Genome Sequencing Consortium.

Direct Submission  
Submitted (26-SEP-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Sep 26, 2002 this sequence version replaced gi:21723602. The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). As a result, the sequence may extend beyond the ends of the clone and there may be contigs that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

Center project name: GPEK  
Center clone name: CH230-39A11

----- Summary Statistics  
Assembly program: Phrap, version 0.990129  
Consensus quality: 288667 bases at least Q40  
Consensus quality: 300638 bases at least Q30  
Consensus quality: 307068 bases at least Q20  
Estimated insert size: 494733; sum-of-contigs estimation  
Quality coverage: 2x in Q20 bases; sum-of-contigs estimation

----- NOTE: Estimated insert size may differ from sequence length  
\* (see [http://www.hgsc.bcm.tmc.edu/docs/genbank\\_draft\\_data.html](http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html))  
\* NOTE: This sequence may represent more than one clone.  
\* NOTE: This is a 'working draft' sequence. It currently consists of 21 contigs. The true order of the pieces

is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

 Baylor Plaza, Houston, TX 77030, USA  
 On Oct 9, 2002 this sequence version replaced gi:21736578.  
 The sequence in this assembly is a combination of BAC based reads  
 and whole genome shotgun sequencing reads assembled using Atlas  
 (http://www.hgsc.bcm.tmc.edu/projects/rac/). Each contig described  
 in the feature table below represents a scaffold in the Atlas  
 assembly (a 'contig-scaffold'). Within each contig-scaffold,  
 individual sequence contigs are ordered and oriented. The sequence  
 by sized gaps filled with Ns to the estimated size. The sequence  
 may extend beyond the ends of the clone and there may be sequence  
 contigs within a contig-scaffold that consist entirely of whole  
 genome shotgun sequence reads. Both end sequences and whole genome  
 shotgun sequence only contigs will be indicated in the feature  
 table.

 -----  
 \* NOTE: This record contains 61 individual  
 \* sequencing reads that have not been assembled into  
 \* contigs. Runs of N are used to separate the reads  
 \* and the order in which they appear is completely  
 \* arbitrary. Low-pass sequence sampling is useful for  
 \* identifying clones that may be gene-rich and allows  
 \* overlap relationships among clones to be deduced.  
 \* However, it should not be assumed that this clone  
 \* will be sequenced to completion. In the event that  
 \* the record is updated, the accession number will  
 \* be preserved.  
 \* 1

## JOURNAL

## COMMENT

Submitted (22-NOV-2001) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA  
All repeats were identified using RepeatMasker:  
Smit, A.F.A. & Green, P. (1996-1997)  
<http://ftp.genome.washington.edu/RM/RepeatMasker.html>

----- Project Information

Center project name: L15120

Center clone name: 126\_H\_4

\* NOTE: This record contains 68 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

Center clone name: 142\_A\_10  
 -----  
 \* NOTE: This record contains 86 individual  
 \* sequencing reads that have not been assembled into  
 \* contigs. Runs of N are used to separate the reads  
 \* and the order in which they appear is completely  
 \* arbitrary. Low-pass sequence sampling is useful for  
 \* identifying clones that may be gene-rich and allows  
 \* overlap relationships among clones to be deduced.  
 \* However, it should not be assumed that this clone  
 \* will be sequenced to completion. In the event that  
 \* the record is updated, the accession number will  
 \* be preserved.  
 \*

 Direct Submission

TITLE  
 JOURNAL  
 COMMENT  
 Submitted (01-APR-2000) Whitehead Institute/MIT Center for Genome  
 Research, 320 Charles Street, Cambridge, MA 02141, USA  
 All repeats were identified using RepeatMasker:  
 Smit, A.F.A. & Green, P. (1996-1997)  
 http://ftp.genome.washington.edu/RM/RepeatMasker.html

Center: Whitehead Institute/ MIT Center for Genome Research  
 Center code: WIBR  
 Web site: http://www.seq.wi.mit.edu  
 Contact: sequence\_submissions@genome.wi.mit.edu  
 Project Information  
 Center project name: L9026  
 Center clone name: 222\_B.7

NOTE: This record contains 76 individual  
 sequencing reads that have not been assembled into  
 contigs. Runs of N are used to separate the reads  
 and the order in which they appear is completely  
 arbitrary. Low-pass sequence sampling is useful for  
 identifying clones that may be gene-rich and allows  
 overlap relationships among clones to be deduced.  
 However, it should not be assumed that this clone  
 will be sequenced to completion. In the event that  
 the record is updated, the accession number will  
 be preserved.

RESULT 57
LOCUS AC021390 81233 bp DNA linear HTG 13-JUL-2000
DEFINITION Homo sapiens clone RP11-27N15, LOW-PASS SEQUENCE SAMPLING.
ACCESSION AC021390
VERSION AC021390.2 GI:9136426
KEYWORDS HTG; HTGS_PHASEO.
SOURCE Homo sapiens (human)
ORGANISM Homo sapiens
Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Primates; Catarrhini; Homnidae; Homo.
REFERENCE 1 (bases 1 to 81233)
AUTHORS Birren,B., Linton,L., Nusbaum,C. and Lander,E.
TITLE Homo sapiens, clone RP11-27N15
JOURNAL Unpublished

Direct Submission
Submitted (16-JUN-2000) Whitehead Institute/MIT Center for Genome
Research, 320 Charles Street, Cambridge, MA 02141, USA
On Jul 13, 2000 this sequence version replaced gi:6705716.
All repeats were identified using RepeatMasker:
Smit, A.F.A. & Green, P. (1996-1997)

----- Project Information
Center project name: L4723
Center clone name: 27_N_15
-----
* NOTE: This record contains 90 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.
